2 **OASIS ebXML Registry Security Sub Team**

3 **Security Proposal for ebXML Registry V2**

4 **Oct 1, 2001**

5 **V 0.2**

6

7 **Authors:**

8 Suresh Damodaran
9 Sanjay Patil

10 **Contributors:**

11 Farrukh Najmi
12 Sekhar Vajjhala

13 **Status of this Document**

14 This document contains a proposal for security specifications for the upcoming Version 2 release
15 of ebXML Registry ("registry"). This is still a work in progress.
16

17 **Revision History**

Date	Version	Who	What
8/13/2001	V 0.10	SD	First version
8/20/2001	V 0.11	SD	Added Sec 1.1 per comments by Farrukh. Did some editorial changes.
8/27/2001	V 0.12	SD	Expanded Sec 3 per Sanjay's comments. Removed Sec 4. Expanded issues.
8/28/2001	V 0.13	SP	Entered "Type category" info in Table 2 as per discussions
9/06/2001	V 0.14	SD	Made minor edits – added Type F
09/19/01	V 0.15	SD	Included Sanjay's use cases
10/01/01	V 0.2	SD	Updated actors, edited use cases section to conform.

18

19 1 Overview

20 The goal of this paper is to evaluate the security concerns for V1, identify the absolutely required
21 features for V2, and propose a means to implement these features. We outline some of the
22 concerns of registry users and use cases. The list of deliverables are at the end.

23 1.1 Security Related Issues with V1

24 The broad issues related to security in version 1 of ebXML Registry are the following.

- 25 1. There is a lack of specificity on how to apply security standards. E.g., Digital Signature.
- 26 2. Some of the security risks are addressed but are costly or difficult to implement. E.g., Digital
27 Signature for authentication of all Registry Users may not be necessary for some Registry
28 Users such as Registry Guest.
- 29 3. Some security risks are not addressed in this specification at all. E.g., Security Policy
30 maintenance.
- 31 4. Version 1 needs to be aligned with other security related OASIS TCs and/or other relevant
32 standards. E.g., XACML

33

34 The major goal of this paper is to identify the absolutely necessary features for V2 and suggest a
35 proposal for providing those features.

36 1.2 Glossary

37 This document uses terminology in RFC 2828 for all terms related to security.

38

39 2 Registry Users

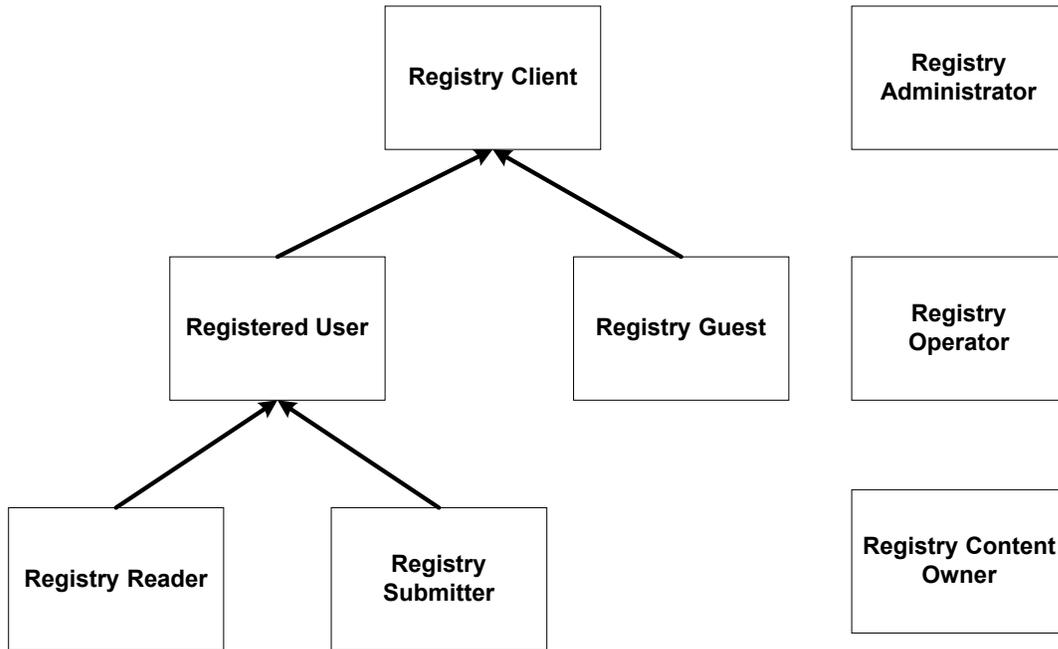

40 We describe the actors who use the registry from the point of view of security and analyze the
41 security concerns of the registry below. This analysis leads up to the security requirements for
42 V2. Some of the actors are defined in Section 9.4.1 of [ebRS]. Note that same entity may take on
43 multiple roles. For example, a Registry Operator and Registry Administrator may have the same
44 identity.

45

Actor	Function	ISO/IEC 11179	Comments
Registry Operator	Hosts the RegistryObjects	Registration Authority (RA)	
Registry Administrator	Evaluates and enforces registry security policy. Facilitates definition of the registry security policy.		MAY be the same as Registry Operator
Registered User	Has a <i>contract</i> with the Registry Operator and MUST be authenticated by Registry Operator.		The contract could be a ebXML CPA conforming or some other form of contract. Section 6.1 [ebRS].
Registry Guest	Has no <i>contract</i> with Registry Operator. Does not have to be authenticated for Registry access. Cannot change contents of the Registry (MAY be permitted to <i>read</i> some RegistryObjects.)		Note that a Registry Guest is <i>not</i> a Registry Reader.
Registry Submitter	A Registered User who does lifecycle operations on	Submitting Organization (SO)	

	permitted RegistryObjects.		
Registry Reader	A Registered User who has only <i>read</i> access		
Registry Content Owner	Creates Registry Objects	Responsible Organization (RO)	RO MAY have the same identity as SO
Registry Client	Registered User or Registered Guest		

46
47

48
49

Note:

- 50 1. In V2, we are not distinguishing between Registry Submitter/Registry Publisher and Registry
- 51 Content Owner.
- 52 2. Registration of a user happens out-of-band for V2.
- 53 3. For V2 we do not distinguish between Registry Administrator and Registry Operator.

54 3 Security Concerns

55 The security risks broadly stem from the following concerns. We analyze these concerns to
56 understand how these are addressed in the current specs and how these needs to be addressed
57 in V2 of the specs.

- 58 1. Is the content of the registry (data) trustworthy?
 - 59 a) How to make sure “what is in the registry” is “what is put there” by a registry publisher?
60 This concern can be addressed by ensuring that the publisher is authenticated using digital
61 signature (Source Integrity), message is not corrupted during transfer using digital signature
62 (Data Integrity), and the data is not altered by unauthorized subjects based on access control
63 policy (Authorization)
 - 64 b) How to protect data while in transmission? What are the most critical types of data?
65 Communication integrity has two ingredients – Data Integrity (addressed in 1a) and Data
66 Confidentiality that can be addressed by encrypting the data in transmission. Replay attack.
 - 67 c) Is the content up to date? The versioning as well as any time stamp processing, when
68 done securely will ensure the “latest content” is guaranteed to be the latest content. Authorization
69 with access control policy could solve this problem.
 - 70 d) How to ensure only bona fide publishers add contents to registry? Ensuring Source
71 Integrity (as in 1a).

- 72 e) How to ensure that bona fide publishers add contents to registry only at authorized
 73 locations? (System Integrity)
- 74 f) What if the publishers deny modifying certain content after-the-fact? To prevent this
 75 (Nonrepudiation) audit trails are to be kept which contain signed message digests.
- 76 g) What if the reader denies getting information from the registry?
- 77 h) How to ensure integrity of classification schemes as well as dynamic data (classification &
 78 association) (Correctness Integrity, may not be a security issue)
- 79 2. How to provide selective access to registry content? The broad answer is, by using an
 80 access control policy – applies to (a), (b), and (c) directly.
- 81 a) How does a registry publisher restrict access to the content to only specific registry
 82 readers?
- 83 b) How can a registry publisher allow some “partners” (fellow publishers) to modify content?
- 84 c) How to provide selective access to partners the registry usage data?
- 85 d) How to prevent accidental access to data by unauthorized users? Especially with hw/sw
 86 failure of the registry security components? The solution to this problem is by having
 87 System Integrity.
- 88 e) Data confidentiality of RegistryObject
- 89 3. How do we make “who can see what” policy itself visible to limited parties, even excluding
 90 the administrator (self & confidential maintenance of access control policy). By making sure
 91 there is an access control policy for accessing the policies themselves.
- 92 4. How to transfer credentials? The broad solution is to use credentials assertion (such as
 93 being worked on in SAML)
- 94 a) How to transfer credentials (authorization/authentication) to federated registries?
- 95 b) How do aggregators get credentials (authorization/authentication) transferred to them?
- 96 c) How to store credentials through a session?
- 97 d) How to store and use credentials for queries triggered by a single query? –
 98 Implementation specific – becomes 4a when multiple registries.
- 99 5. How to bind the registry security mechanisms to security infrastructure? The definition of the
 100 security infrastructure and binding to the infrastructure to do security related processing will
 101 solve this problem.

102 4 Use Cases

103 The use cases below combine the actors defined earlier with the actions (defined below) with the
 104 security concerns described earlier.

105 4.1 Actions

- 106 Publish Actions (“Life Cycle Actions_[sd1]” as in Section 6.4.3 and 7.1 [ebRS])
- 107 submitObject_[sd2]
- 108 approveObject
- 109 deprecateObject
- 110 removeObject
- 111
- 112 Read Actions
- 113 Query, audit query
- 114 Update Actions
- 115 update (same as submitObject above)_[sd3]
- 116 Administrative Actions
- 117 Retrieve operational statistics, shutdown, startup
- 118

119 4.2 Use cases

- 120 1. Registry Operator wants to differentiate between Registered Users and Registry Guests.
 121 Business use case example – Registry Operator wants to provide access to richer
 122 capabilities to Registered users and limited capabilities to Registry Guests.

- 123 2. Registry Operator wants to decide whether or not to allow an action that Registry Client
124 wants to perform
125 Business use case example – allow only Registered Users to “Publish”
126 3. Registry Operator wants to restrict execution of administrative processes to only Registry
127 Administrator
128 Business use case example – prevent shut down of the Registry by users other than
129 Registry Administrator
130 4. Registry Operator wants to restrict operations on Registry to only authenticated and
131 authorized Registry Clients
132 Business use case example – prevent access to Registry by a user who is not Registered
133 and impersonating as a Registered User
134 5. Registry Operator wants to restrict sending Response objects to authenticated and
135 authorized Registry Clients
136 Business use case example – prevent sending sensitive Response Object to
137 unauthenticated and unauthorized recipients
138 6. Registry Client wants to ensure that the Registry Operator is authenticated
139 Business use case example – Registry client does not want to publish his sensitive
140 business content to a hoax Registry
141 7. Registry Client wants to restrict, which other Registry Clients can access the Registry
142 Content it is publishing to the Registry.
143 8. Registry Client wants to ensure that the Registry Content it is publishing to Registry is not
144 visible on the network
145 Business use case example – Credit Card Information
146 9. Registry Client wants to ensure that the Registry Content it is publishing to Registry is not
147 changed on the network
148 10. Registry Client wants to ensure that the Registry Content it has published to Registry is
149 not visible to the Registry Administrator
150 11. Registry Client wants to ensure that the Registry Content it has published to Registry is
151 not changed by the Registry Administrator
152 12. Registry Client wants to ensure that the Registry Content sent to it by Registry is not
153 visible on the network
154 13. Registry Client wants to ensure that the Registry Content sent to it by Registry is not
155 changed on the network
156 14. Registry Client wants to ensure that the source of Registry Content received from
157 Registry is verifiable
158 Business use case example – The information claiming to have been published by a
159 company XYZ was really published by the company XYZ.
160 15. Registry Client wants to build and store sufficient evidence of its requests being received
161 by Registry
162 16. Registry Client wants to build and store sufficient evidence of response being received
163 from Registry
164 17. Registry wants to build and store sufficient evidence of response being sent to Registry
165 Client
166 18. Registry wants to build and store sufficient evidence of receiving request from Registry
167 Client
168 19. Registry Client wants to retrieve information about the access of a particular Registry
169 Object
170 a. by all or a specified set of Registry Clients,
171 b. since the creation of the Registry Object,
172 c. from a specified time,
173 d. from a specified identifiable Registry event.
174

175 4.2.1 Relationship to Security Risks

176 Classification of use cases in terms of security concerns

- 177 1. Role Identification (Risk 2)
- 178 2. Access Control (Risk 2)
- 179 3. Peer Entity Authentication (Risk 1)
- 180 4. Data Confidentiality (in persistence) (Risk 2e)
- 181 5. Data Integrity (in persistence) (Risk 1)
- 182 6. Data Confidentiality (in transit) (Risk 1)
- 183 7. Data Integrity (in transit) (Risk 1)
- 184 8. Data Origin Authentication (Risk 1)
- 185 9. NonRepudiation (Risk 1f, 1g)
- 186 10. Auditing (Risk 2c)

187 **5 Addressing the Risks**

188 **5.1 Risk Management in Current Specs**

189 Section 9 of [ebRS] describes the current techniques to address the risks outline earlier. We
 190 briefly outline the current techniques and which risks they manage.

191 **5.1.1 Current Techniques**

192 Refer to the table in Section 3.

193 NA – Not Available

Concern	Techniques	Issues
1a: How to make sure “what is in the registry” is “what is put there” by a registry publisher?	1. Message Payload Signature [Sec 9.1.1]	2. Costly to process and maintain. Instead: (a) signature for packages? (b) Signature for envelopes only, and signature discarded 2. Not clear on the definition of “contents”
1b: How to protect data while in transmission? What are the most critical types of data?	1. Message Payload Signature [Sec 9.1.1]	1. Same as 1a. above. 2. Confidentiality requires encryption of transmitted data
1c: Is the content up to date?	NA	1. Versioning not included in signing
1d: How to ensure only bona fide publishers add contents to registry?	1. Digital signature and trust management based authentication	
1e: How to ensure that bona fide publishers add contents to registry only at authorized locations?	NA	
1f: What if the publishers deny modifying certain content after-the-fact?	1. Only the publisher can modify the content	
1g: How to ensure integrity of classification schemes as well as dynamic data (classification & association)	NA	

2a: How does a registry publisher restrict access to the content to only specific registry readers?	1. An access control policy	<ol style="list-style-type: none"> 1. Only default access control policy that allows authenticated Registry Clients unlimited access to the content 2. RS did not have interfaces to manipulate access control policy 3. Current granularity of access control is at the method level – better if we can restrict the methods to create/update/version/delete
2b: How can a registry publisher allow some “partners” (fellow publishers) to modify content?	1. An access control policy	1. Same as 2a
2c: How to provide selective access to partners the registry usage data?	NA	
2d: How to prevent accidental access to unsolicited data? Especially with hw/sw failure of the registry security components?	NA	
2e: Data Confidentiality of Registry Content while in storage	NA – recommends encryption	
3: How do we make “who can see what” policy itself visible to limited parties, even excluding the administrator (self & confidential maintenance of access control policy)	NA	
4a: How to transfer credentials (authorization/authentication) to federated registries?	NA	
4b: How do aggregators get credentials (authorization/authentication) transferred to them?	NA	
4c: How to store credentials through a session?		1. No session concept at this time- so not an issue
4d: How to store and use credentials for queries triggered by a single query?	NA	
5: How to bind the registry security mechanisms to security infrastructure?	1. Trust management services are mentioned	1. No clear guidelines on how to use the services

194 **5.2 Newer Version of Security**

195 We describe below how the newer version of security would address the same security concerns
 196 discussed earlier. We need to prioritize which of the risks to be addressed for the next version.
 197 Below is the table that outlines the prioritized list.

198
 199 Legend:

200 **Type** in the table enumerates as follows:

201 Type A) **A**bsolutely required for V2. Belongs to “bug fix” category to V1

202 Type B) Absolutely required for V2. New for V2, not considered for V1.

203 Type C) Having this feature will give V2 **C**ompetitive advantage. Neither Type A or Type B.

204 Type D) Nice to have in V2 – will make V2 really convenient to use and rich.

205 Type F) **F**uturistic

206

Concern	Techniques	Issues	Type
1a: How to make sure “what is in the registry” is “what is put there” by a registry publisher?			C
1b: How to protect data while in transmission? What are the most critical types of data?			C
1c: Is the content up to date?			D
1d: How to ensure only bona fide publishers add contents to registry?			A
1e: How to ensure that bona fide publishers add contents to registry only at authorized locations?			F
1f: What if the publishers deny modifying certain content after-the-fact?			C
1g: How to ensure integrity of classification schemes as well as dynamic data (classification & association)			Out of scope
1h: What if the reader denies getting information from the registry?			C
2a: How does a registry publisher restrict access to the content to only specific registry readers?			A
2b: How can a registry publisher allow some “partners” (fellow publishers) to modify content?			A
2c: How to provide selective			D

access to partners the registry usage data?			
2d: How to prevent accidental access to unsolicited data? Especially with hw/sw failure of the registry security components?			F
2e: Data Confidentiality of Registry Content while in repository			C
3: How do we make “who can see what” policy itself visible to limited parties, even excluding the administrator (self & confidential maintenance of access control policy)			F
4a: How to transfer credentials (authorization/authentication) to federated registries?			F
4b: How do aggregators get credentials (authorization/authentication) transferred to them?			C
4c: How to store credentials through a session?			F
4d: How to store and use credentials for queries triggered by a single query?			Implementation Detail
5: How to bind the registry security mechanisms to security infrastructure?			D

207
208

209 **6 Deliverables**

210 The deliverables for V2 are:

- 211 1. This document, i.e., security proposal
- 212 2. A separate document to address 1d above, with primary focus on Data Integrity

213

214 We did not address 2a and 2b through authorization policy schema and cookie cutter policies for
215 V2, though we are currently working on it, and we plan to address these going forward.

216

217 **7 Issues**

218

- 219 1. Reconcile the actors in the registry to actors in this doc. ISO 11179 terminology also needs to
220 be reconciled.
- 221 2. Registry Profiles need to be defined. Currently, there is no clear definition of the Registry
222 profile.
- 223 3. Bootstrapping process needs to be defined.

- 224 4. Update operation currently is done through submitObjects(). Does a new version get
225 assigned to the RegistryObject when a submitObject() is done?
226 5. The steps involved in executing the relevant use cases from the point of view of security
227 needs to be described.
