Abstract:

The SCA Web Service binding specified in this document applies to the services and references of an SCA composites. It defines the manner in which a service can be made available as a web service, and in which a reference can invoke a web service.

This binding is a WSDL-based binding; that means it either references an existing WSDL binding or allows one to specify enough information to generate one. When an existing WSDL binding is not referenced, rules defined in this document allow one to generate a WSDL binding.

Status:

This document was last revised or approved by the OASIS Service Component Architecture / Bindings (SCA-Bindings) TC on the above date. The level of approval is also listed above. Check the "Latest Version" or "Latest Approved Version" location noted above for possible later revisions of this document. Technical Committee members should send comments on this specification to the Technical Committee's email list. Others should send comments to the Technical Committee by using the "Send A Comment" button on the Technical Committee's web page at http://www.oasis-open.org/committee/sca-bindings/.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (http://www.oasis-open.org/committees/sca-bindings/ipr.php.

The non-normative errata page for this specification is located at http://www.oasisopen.org/committees/sca-bindings/.

Notices

Copyright © OASIS® 2006, 2008. All Rights Reserved.

All capitalized terms in the following text have the meanings assigned to them in the OASIS Intellectual Property Rights Policy (the "OASIS IPR Policy"). The full Policy may be found at the OASIS website.

This document and translations of it may be copied and furnished to others, and derivative works that comment on or otherwise explain it or assist in its implementation may be prepared, copied, published, and distributed, in whole or in part, without restriction of any kind, provided that the above copyright notice and this section are included on all such copies and derivative works. However, this document itself may not be modified in any way, including by removing the copyright notice or references to OASIS, except as needed for the purpose of developing any document or deliverable produced by an OASIS Technical Committee (in which case the rules applicable to copyrights, as set forth in the OASIS IPR Policy, must be followed) or as required to translate it into languages other than English.

The limited permissions granted above are perpetual and will not be revoked by OASIS or its successors or assigns.

This document and the information contained herein is provided on an "AS IS" basis and OASIS DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY OWNERSHIP RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

OASIS requests that any OASIS Party or any other party that believes it has patent claims that would necessarily be infringed by implementations of this OASIS Committee Specification or OASIS Standard, to notify OASIS TC Administrator and provide an indication of its willingness to grant patent licenses to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification.

OASIS invites any party to contact the OASIS TC Administrator if it is aware of a claim of ownership of any patent claims that would necessarily be infringed by implementations of this specification by a patent holder that is not willing to provide a license to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification. OASIS may include such claims on its website, but disclaims any obligation to do so.

OASIS takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on OASIS' procedures with respect to rights in any document or deliverable produced by an OASIS Technical Committee can be found on the OASIS website. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this OASIS Committee Specification or OASIS Standard, can be obtained from the OASIS TC Administrator. OASIS makes no representation that any information or list of intellectual property rights will at any time be complete, or that any claims in such list are, in fact, Essential Claims.

The names "OASIS" is a trademark of OASIS, the owner and developer of this specification, and should be used only to refer to the organization and its official outputs. OASIS welcomes reference to, and implementation and use of, specifications, while reserving the right to enforce its marks against misleading uses. Please see http://www.oasis-open.org/who/trademark.php for above guidance.

1 1 Introduction

- 2 The SCA Web Service binding specified in this document applies to the services and references of composites 3 and components [SCA-Assembly]. It defines the manner in which a service can be made available as a web 4 service, and in which a reference can invoke a web service.
- 5 This binding is a WSDL-based binding; that means it either references an existing WSDL binding or can be 6 configured to specify enough information to generate one. When an existing WSDL binding is not referenced, 7 rules defined in this document allow one to generate a WSDL binding.
- 8 The Web Service binding can point to an existing WSDL [WSDL] document, separately authored, that specifies 9 the details of the WSDL binding to be used to provide or invoke the web service. In this case the SCA web
- 10 services binding allows anything that is valid in a WSDL binding, including rpc-encoded style and binding
- extensions. It is the responsibility of the SCA system provider to ensure support for all options specified in the
 WSDL binding. Interoperation of such services is not guaranteed.
- 13 The SCA Web Service binding also provides attributes that can be used to provide the details of a WSDL SOAP 14 binding. This allows a WSDL document to be synthesized in the case that one does not already exist. In this 15 case only WS-I compliant mapping is supported.
- 16 The SCA Web Service binding can be further customized through the use of SCA Policy Sets. For example, a 17 requirement to conform to a WS-I profile [WSI-Profiles] could be represented with a policy set.
- This specification also defines a protocol for implementing callbacks using the WS-Addressing Message
 Addressing Properties [WS-Addr].

20 1.1 Terminology

- The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD
 NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in
 [[**RFC2119**]].
- 24 This specification uses predefined namespace prefixes throughout; they are given in the following list. Note that 25 the choice of any namespace prefix is arbitrary and not semantically significant.
- 26 Table 1-1 Prefixes and Namespaces used in this specification

Prefix	Namespace	Notes	
xs	"http://www.w3.org/2001/XMLSchema"	Defined by XML Schema 1.0 specification

64 2 Web Service Binding Schema

111	e We	b Service binding element is defined by the following pseudo-schema.
<bi< th=""><th>nding r v v v endp indin</th><th><pre>z.ws name="xs:NCName"? equires="list of xs:QName"?</pre></th></bi<>	nding r v v v endp indin	<pre>z.ws name="xs:NCName"? equires="list of xs:QName"?</pre>
•	/bii	nding.ws/@name - as defined in the SCA Assembly Specification [SCA-Assembly].
•	/bii	nding.ws/@requires - as defined in the SCA Assembly Specification [SCA-Assembly].
•	/bii	nding.ws/@policySets - as defined in the SCA Assembly Specification [SCA-Assembly].
•	/bii	nding.ws/@uri - the resolution algorithm of Section 2.1 below describes how this attribute is interpr
•	/ bi attr for	nding.ws/@wsdlElement – when present this attribute specifies the URI of a WSDL element. This ribute points to the specified element in an existing WSDL document. The URI can have the follow ms:
	0	Service:
		<wsdl-namespace-uri>#wsdl.service(<service-name>)</service-name></wsdl-namespace-uri>
		In this case, the SCA runtime MUST make all the ports in the WSDL Service that have equivalen portTypes with the SCA service or reference available to the SCA service or reference.
	0	Port (WSDL 1.1):
		<wsdl-namespace-uri>#wsdl.port(<service-name>/<port-name>)</port-name></service-name></wsdl-namespace-uri>
		In this case, the port in the WSDL 1.1 Service identified by the binding.ws> element MUST implement a portType that is equivalent to the one specified for the SCA service or reference. The identified port MUST be made available to the SCA service or reference by the SCA runtime.
	0	Endpoint (WSDL 2.0):
		<wsdl-namespace-uri>#wsdl.endpoint(<service-name>/<endpoint-name>)</endpoint-name></service-name></wsdl-namespace-uri>
		In this case, the endpoint in the WSDL 2.0 Service identified by the binding.ws> element MUS' have an equivalent portType with the SCA service or reference. The identified endpoint MUST b made available to the SCA service or reference by the SCA runtime.
	0	Binding:
		<wsdl-namespace-uri>#wsdl.binding(<binding-name>)</binding-name></wsdl-namespace-uri>
		In this case, the WSDL binding identified by the binding.ws> element MUST implement a port' that is equivalent to the one specified for the SCA service or reference. The SCA runtime MUST make the service or reference available via the specified WSDL binding. In this case, the endpoin address URI for an SCA reference MUST be specified by either the @uri attribute on the binding WS-Addressing EndpointReference element, except where the SCA Assembly specification state

sca-binding-ws-1.1-spec-cd02 Copyright © OASIS® 2006, 2008. All Rights Reserved. 16th February 2009 Page 8 of 31

107		element of an SCA reference is determined as specified in section 2.1. For the <i>callback</i> element of an
108		SCA service, the binding MUST NOT specify an endpoint address URI or a WS-Addressing
109		EndpointReference
110	•	/binding.ws/@wsdli:wsdlLocation - when present this attribute specifies the location(s) of the WSDL
111		document(s) associated with specific namespace(s). This attribute MAY be specified by the binding in the
112		event that the <wsdl-namespace-uri> in the 'endpoint' attribute is not dereferencable, or when the</wsdl-namespace-uri>
113		intended WSDL document is to be found at a different location than the one pointed to by the <wsdl-< td=""></wsdl-<>
114		namespace-URI>. The use of this attribute indicates that the WSDL binding points to an existing WSDL
115		document. The semantics of this attribute are specified in Section 7.1 of WSDL 2.0 [WSDL].
116	•	/binding.ws/endpointReference - when present this element provides the WS-Addressing [WS-Addr]
117		Endersint Defense that an efficient the and exist for the semiler or reference. When this element is around

- 117
 EndpointReference that specifies the endpoint for the service or reference. When this element is present

 118
 along with the @wsdlElement attribute on the parent element, the @wsdlElement attribute value MUST be

 119
 of the 'Binding' form as specified above, i.e. <WSDL-namespace-URI>#wsdl.binding(
binding-name>).
- /binding.ws/@{any} this is an extensibility mechanism to allow extensibility via attributes.
- 121 /binding.ws/any this is an extensibility mechanism to allow extensibility via elements.
- 123
 The SCA runtime MUST support all the attributes of the <bindming.ws> element, namely @name, @uri,

 124
 @requires, @policySets @wsdlElement, and @wsdli:wsdlLocation.
- 125
 The SCA runtime SHOULD support the element <endpointReference>. If an SCA runtime does not support the

 126
 element <endpointReference>, then it MUST reject an SCA WS Binding XML document (as defined in Section

 127
 <u>6</u>5.1) that contains the element.
 - The

 binding.ws> element MUST conform to the XML schema defined in sca-binding-webservice.xsd.

129 2.1 Endpoint URI resolution

122

128

132

133

134

135

- 130 The rules for resolving the URI at which an SCA service is hosted, or SCA reference targets, when used with 131 binding.ws (in precedence order) are:
 - 1. The URIs in the endpoint(s) of the referenced WSDL
 - The URI specified by the wsa:Address element of the endpointReference,
 - 2. The explicitly stated URI in the @uri attribute of the binding.ws element, which can be relative,
- 136 3. The structural URI as defined by the Assembly specification
- 137 An SCA runtime MUST follow rules listed above in determining the URI at which an SCA service is hosted or138 an SCA reference is targeted.
- 139 The URI in the WSDL endpoint or in the *wsa:Address* of an EPR MAY be a relative URI, in which case it is
- relative to the URI defined in (2) or (3). The *wsa:Address* element MAY be the empty relative URI, in which
 case it uses the URI defined in (2) or (3) directly. This enables the EPR writer to specify reference parameters,
 metadata and other EPR contents while letting the deployer choose the URI.
- 143To reference a WSDL document and also specify an EPR, the @wsdlElement attribute MUST refer to a binding144element in the WSDL.

145 **2.2 Interface mapping**

- When *binding.ws* is used on a service or reference with an interface that is not defined by *interface.wsdl*, then a
 WSDL portType for the service or reference is derived from the interface by the rules defined for that SCA
 interface type. An SCA runtime MUST raise an error if the interface does not map to a WSDL portType.
- 149 For example, for *interface.java*, the mapping to a WSDL portType is as defined in the SCA Java Common 150 Annotations and API Specification [SCA-JCAA].

sca-binding-ws-1.1-spec-cd02 Copyright © OASIS® 2006, 2008. All Rights Reserved. 16th February 2009 Page 9 of 31 binding.ws implementations can use appropriate standards, for example WS-I AP 1.0 [WSI-AP] or MTOM
 [MTOM], to map interface parameters to binary attachments transparently to the target component.

153

154 **2.3 Production of WSDL description for an SCA service**

Any service hosted by an SCA runtime with one or more web service bindings with HTTP endpoints SHOULD
 return a WSDL description of the service in response to an HTTP GET request with the "?wsdl" suffix to that
 HTTP endpoint. If none of the web service bindings have HTTP endpoints, then some other means of obtaining
 the WSDL description of the service SHOULD be provided by the SCA runtime. This can include out of band

159 mechanisms, for example publication to a UDDI registry.

- 160 Refer to section 4 for a detailed definition of the rules that SHOULD be used for generating the WSDL
- 161 description of an SCA service with one or more web service bindings.
- 162

163 2.4 Additional binding configuration data

164 SCA runtime implementations MAY provide additional metadata that is associated with a web service binding, 165 for example to enable JAX-WS [JAX-WS] handlers to be executed as part of the target component dispatch.

- 166 The specification of such metadata is SCA runtime-specific and is outside of the scope of this document.
- 167

168 2.5 Web Service Binding and SOAP Intermediaries

- 169 The Web Service binding does not provide any direct or explicit support for SOAP intermediaries [SOAP].
- 170

171 **2.6 Support for WSDL extensibility**

- 172 When a binding we element uses the @wsdlElement attribute, the details of the binding are specified by the 173 WSDL element referenced by the value of the attribute. Per the WSDL specification, WSDL allows for 174 extensibility via elements as well as attributes, and it specifies rules for processing such elements. This 175 specification does not constrain the use of such extensibility in WSDL and relies on the rules specified in the
- specification does not constrain the use of such extensibility in WSDL and relies on the rules specified in the
 WSDL specification for processing such extended elements.
- 177This specification requires that an SCA runtime MUST support the WSDL extensions defined in the namespace178associated with the prefix "sca" (as defined in section 1.1).
- 179The SCA runtime MUST support the WSDL 1.1 binding extension for SOAP 1.1 over HTTP [WSDL11], as180identified by the WSDL element wsoap11:binding that has the @transport attribute with a value of
- 181 "http://schemas.xmlsoap.org/soap/http".
- 182
 The SCA runtime SHOULD support the WSDL 1.1 binding extension for SOAP 1.2 over HTTP [WSDL11

 183
 SOAP12], as identified by the WSDL element wsoap12:binding that has the @transport attribute with a value of
- 184 "http://schemas.xmlsoap.org/soap/http".
- 185Because a WSDL document might contain extension elements that cannot be supported by the SCA runtime,186when using the @wsdlElement form of binding.ws it is not possible to determine whether the binding is
- 187 supported by the SCA runtime without parsing the referenced WSDL element and its dependent elements.

188 2.7 Intents listed in the bindingType

189This specification places no requirements on the intents that are listed as either @alwaysProvides or190@mayProvides in the bindingType for binding.ws.

sca-binding-ws-1.1-spec-cd02 Copyright © OASIS® 2006, 2008. All Rights Reserved. 16th February 2009 Page 10 of 31

2.8 Intents and binding configuration 191

This binding mandates support for SOAP 1.1 and encourages SOAP 1.2 support. The

kindingType> element 192 193 associated with this binding MUST include the SOAP.1_1 intent in its @mayProvides or @alwaysProvides 194 attributes. If the

bindingType> element associated with this binding does not include the SOAP.1_1 intent in 195 its @alwaysProvides attribute, then the
bindingType> element SHOULD include the SOAP.1_2 intent in its 196 @mayProvides attribute. For more details on the <bindingType> element see [SCA-Policy].

197 The SCA runtime MUST raise an error if the web service binding is configured with a policy intent(s) that

198 conflicts with a binding instance's configuration. For example, it is an error to use the SOAP policy intent in combination with a WSDL binding that does not use SOAP. 199

The following snippets show the sca.composite file for the MyValueComposite file containing the service 201 element for the MyValueService and reference element for the StockQuoteService. Both the service and the 202 203 reference use a Web Service binding. 204 3.1 Example Using WSDL documents 205 This example shows a service and reference using the SCA Web Service binding, using existing WSDL 206 207

3 Web Service Binding Examples

200

- documents in both cases. In each case there is a single binding element, whose name defaults to the 208 service/reference name.
- 209 The service's binding is defined by the WSDL document associated with the given URI. This service conforms to WS-I Basic Profile 1.1. 210
- 211 The reference's first binding is defined by the specified WSDL service in the WSDL document at the given 212 location. The reference can use any of the WSDL service's ports/endpoints to invoke the target service. The 213 reference's second binding is defined by the specified WSDL binding. The specific endpoint URI to be invoked 214 is provided via the @uri attribute.

243	
244	
	*

3.2 Examples Without a WSDL Document 245

The next example shows the simplest form of the binding element without WSDL document, assuming all 246 247 defaults for portType mapping and SOAP binding synthesis. The service and reference each have a single 248 binding element, whose name defaults to the service/reference name.

sca-binding-ws-1.1-spec-cd02 Copyright © OASIS® 2006, 2008. All Rights Reserved.

16th February 2009 Page 12 of 31 The service is to be made available at a location determined by the deployment of this component. It will have a single port address and SOAP binding, with a simple WS-I BasicProfile 1.1 compliant binding, and using the default options for mapping the Java interface to a WSDL portType.

The reference indicates a service to be invoked which has a SOAP binding and portType that matches the default options for binding synthesis and interface mapping. One particular use of this case would be where the reference is to an SCA service with a web service binding which itself uses all the defaults.

	name="MyValueComposite">
<s< th=""><th>ervice name="MyValueService"></th></s<>	ervice name="MyValueService">
•	<interface.java interface="services.myvalue.MyValueService"></interface.java>
</td <td>service></td>	service>
<r< td=""><td>eference name="StockOuoteService"></td></r<>	eference name="StockOuoteService">
	<interface.java interface="services.stockguote.StockQuoteService"></interface.java>
	 sinding.ws uri="http://www.example.org/StockQuoteService"/>
</td <td>reference></td>	reference>
<td>mposite></td>	mposite>

The next example shows the use of the binding element without a WSDL document, with multiple SOAP bindings with non-default values. The SOAP 1.2 binding name defaults to the service name, the SOAP 1.1 binding is given an explicit name. The reference has a web service binding which uses SOAP 1.2, but otherwise uses all the defaults for SOAP binding. The reference binding name defaults to the reference name.

299 3.3 Example PolicySet Providing The Conversation Intent

 300
 The following policy set applies to *binding.ws* and provides the conversation intent. The conversation intent is

 301
 provided by using WS-ReliableMessaging [WS-RM] protocol which has a concept of a Sequence. This

 302
 Sequence (which appears as a wsrm:Sequence SOAP header in the message) is used as a correlation

 303
 mechanism, on the wire, to implement conversational semantics.

sca-binding-ws-1.1-spec-cd02 Copyright © OASIS® 2006, 2008. All Rights Reserved. 16th February 2009 Page 13 of 31

304	<pre><policyset <="" name="WSRM-Sequence-based-conversation" pre=""></policyset></pre>

307	<wsp:policy></wsp:policy>
308	<wsrmp:rmassertion< th=""></wsrmp:rmassertion<>
309	xmlns:wsrmp="http://docs.oasis-open.org/ws-rx/wsrmp/200608"/>
310	
311	
312	

16th February 2009 Page 14 of 31

313 4 Transport Binding

- 314 The binding we element provides numerous ways to specify exactly how messages ought to be transmitted from
- 315 or to the reference or service. Those ways include references to WSDL binding elements from the
- 316 @wsdlElement attribute, policy intents, and even vendor extensions within the binding.ws element. However,
- 317 all of those ways to indicate how messages get carried happen to be optional. This section describes the defaults
- to be used if the specific transport details are not otherwise specified.

319 4.1 Intents

So as to narrow the range of choices for how messages are carried, the following policy intents affect the transport binding:

322 • SOAP

323

325

333

334

341

344 345 This indicates that messages MUST be transmitted using SOAP. One or more SOAP versions can be used.

- 324 SOAP.1_1
 - Messages MUST be transmitted using only SOAP 1.1.
- SOAP.1_2
 Messages MUST be transmitted using only SOAP 1.2.

328 4.2 Default Transport Binding Rules

329 4.2.1 WS-I Basic Profile Alignment

330To align to WS-I Basic Profile, the resulting WSDL port needs to be all document-literal, or all rpc-literal331binding (R2705). This means, for any given portType, for all messages referenced by all operations in that332portType, either

- that every message part references an XML Schema type (rpc-literal pattern)
- or that every message references exactly zero or one XML Schema elements (document-literal pattern)
- For a service element, the portType from the service's interface or derived from the service's interface MUST fit one of these two patterns. The rest of this section assumes the short-hand reference of an "rpc-literal" or "document-literal" pattern, depending on which of the two bullet points above it matches.

338 4.2.2 Default Transport Binding Rules

In the event that the transport details are not otherwise determined, an SCA runtime MUST enable the followingconfiguration:

- HTTP-based transfer protocol
- Bindings for SOAP 1.1 MUST be provided and additional bindings MAY be provided, unless policy is
 applied that explicitly restricts this.
 - "literal" format as described in section 3.5 of [WSDL11]
 - For document literal pattern, each message uses "document" style, as per section 3.5 of [WSDL11].
- For rpc-literal pattern, each message uses "rpc" style, as per section 3.5 of [WSDL11]. In this case, the child elements of the SOAP Body element MUST be namespace qualified with a non-empty namespace name. This namespace SHOULD be the structural URI associated with the binding.
- For SOAP 1.1 messages, the SOAPAction HTTP header described in section 6.1.1 represents the empty string, in quotes ("").

sca-binding-ws-1.1-spec-cd02 Copyright © OASIS® 2006, 2008. All Rights Reserved. 16th February 2009 Page 15 of 31

- For SOAP 1.2 messages, the SOAP Action feature described in section 6.5 of [SOAP12Adjuncts] does not appear.
- All WSDL message parts are carried in the SOAP body

16th February 2009 Page 16 of 31

354	5 SCA Web Services Callback Protocol	-	
355 356 357	This section defines the SCA Web Services callback protocol that can be used to implement a bidirectional interface in conjunction with the Web Services binding. For examples of wire messages exchanged when using this protocol see Appendix D.		
358 359	An SCA Runtime MAY implement SCA callback services over the Web services binding using WS-Addressing 1.0 capabilities, as described in this section.		
360	To implement this protocol, an SCA binding follows the following rules.		
361 362 363	 Every request message that invokes the forward interface MUST contain a Callback EPR. The Callback EPR MUST be carried in the request message in one of the following ways: 		Formatted: Bullets and Numbering
364 365	a. If the request message contains the wsa:From SOAP header block then the wsa:From header block specifies the Callback EPR.		
366 367	b. If the wsa:From header block is not present then the wsa:ReplyTo header block specifies the Callback EPR.		
368 369 370 371 372 373	If the Callback EPR's [address] value is "http://www.w3.org/2005/08/addressing/anonymous" or "http://www.w3.org/2005/08/addressing/none" then the SCA runtime MUST generate the Invalid Addressing Header fault as specified in WS-Addressing 1.0 SOAP Binding, Section 6.4.1 [WS-Addr-SOAP]. Such a fault can include additional [Subsubcode] wsa:OnlyNonAnonymousAddressSupported.		Formatted: Indent: Left: 0.75"
374 375 376 377	2. A request message that invokes the forward interface can contain the <u>wsa:MessageID SOAP header block. If there is a need to have the callback</u> request message correlated to an individual forward request message, the <u>wsa:MessageID SOAP header block can be used for this purpose.</u>		Formatted: Bullets and Numbering
378 379 380 381 382	3. When the service implementation invokes the callback interface, it MUST use the Callback EPR from a request message that invoked the forward interface, as specified in step 1. Once the Callback EPR is selected, the SCA runtime MUST follow the rules defined in WS-Addressing 1.0 Core Section 3.3 to invoke operations on the callback interface.		
383 384 385 386 387 388 389	When the service invokes the callback interface, if the request message from which the Callback EPR was obtained contained the wsa:MessageID SOAP header block, the SCA runtime MUST include a wsa:RelatesTo SOAP header block in the callback message. The wsa:RelatesTo SOAP header block MUST have the relationship type value of "http://docs.oasis-open.org/opencsa/sca-bindings/ws/callback" and the related message id MUST be the wsa:MessageID of the message from which the Callback EPR was obtained.		
390 391 392 393 394	If the request message from which the Callback EPR was obtained did not contain the wsa:MessageID SOAP header block, the SCA runtime MUST NOT include a wsa:RelatesTo SOAP header block with a relationship type value of "http://docs.oasis-open.org/opencsa/sca-bindings/ws/callback" in the callback message.		
395 396 397	When a service that offers a bidirectional interface is invoked, depending on the semantics and/or implementation of the service, it is possible that the service might invoke the callback interface before the forward operation ends. In such cases, it is		

16th February 2009 Page 17 of 31 Formatted: Bullets and Numbering

398 399 400	necessary for the binding on the reference-side to be listening for callback request(s) from the service, before the forward operation request is sent on the wire to the service, and continue listening as long as callback requests are expected. It is possible that	
401 402	before the response to the forward request is sent a response to one or more callback requests are required by the service.	
403	5.1 Composability with WS-MakeConnection	 Formatted: Bullets and Numbering
404 405 406 407 408	It is possible that the invoker of a service that uses a bidirectional interface has a binding that cannot accept connections for callbacks from a service (for example, when it has the noListener intent [SCA-Policy]). When this is the case, it is necessary for the binding to support a polling mechanism. An example of a polling mechanism is WS-MakeConnection. [WS-MC].	
409 410 411 412 413	For the Web services binding, an SCA Runtime MAY implement SCA callback services over the Web services binding using WS-Addressing 1.0 capabilities combined with WS- MakeConnection, as described in this section. When an SCA runtime does implement such a capability, it MUST adhere to the rules described above (Section 5) and that of WS-MakeConnection, in addition to the rules described in this section.	
414 415 416 417	The Callback EPR's [address] value present in the request message that invoked the forward interface MUST follow the form of the MakeConnection Anonymous URI, i.e. "http://docs.oasis-open.org/ws-rx/wsmc/200702/anonymous?id={unique- String}".	
418 419	The unique-String value is a globally unique value such as a UUID, as defined by the WS-MakeConnection specification.	
420 421 422 423 424	When the service implementation invokes the callback interface, it uses the Callback EPR from a request message that invoked the forward interface, and the callback request message MUST be sent as the response to a wsmc:MakeConnection message that contains the wsmc:Address value that matches the MakeConnection Anonymous URI in the Callback EPR.	
425 426 427 428	When a service that offers a bidirectional interface is invoked using WS-MakeConnection Anonymous URI, as the value for the Callback EPR address, depending on the semantics and/or implementation of the service, it is possible that the service might invoke the callback interface before the forward operation ends. In such cases, it is necessary for	
429 430 431 432 433	the binding on the reference-side to start polling for callback request(s) from the service, before or right after the forward operation request is sent and before a response is received, and continue polling as long as callback requests are expected. It is possible that before the response to the forward request is sent a response to one or more callback requests are required by the service.	
434	5.2 Policy Assertion	 Formatted: Bullets and Numbering
435 436 437 438 439 440	<u>WS-Policy Framework [WS-Policy]</u> and WS-Policy Attachment [WS-PA] collectively define a framework, model and grammar for expressing the requirements, and general characteristics of entities in an XML Web services-based system. To enable a Web service client and a Web service to describe their requirements for implementing SCA Web Services Callback Protocol (see SCA Web Services Callback Protocol), this specification defines a single policy assertion that leverages the WS-Policy framework.	
441	5.2.1 Assertion Model	 Formatted: Bullets and Numbering
442 443	The WSCallback policy assertion indicates that the Web service client and the Web service MUST use SCA Web Services Callback Protocol to implement callbacks.	
	sca-binding-ws-1.1-spec-cd02 16 th February 2009 Copyright © OASIS® 2006, 2008. All Rights Reserved. Page 18 of 31	

		Formatted: Bullets and Numbering
5.2.2 Normative Outline	•	Formatted. Bullets and Numbering
The normative outline for the WSCallback assertion is:		
<sca:wscallback></sca:wscallback>		
The following describes the content model of the WSCallback element.		
 _/sca:WSCallback: A policy assertion that specifies that WSCallback protocol 	•	Formatted
MUST be used when sending messages.		Formatted: Bullets and Numbering
5.2.3 Assertion Attachment		
The WSCallback policy assertion is allowed to have the following Policy Subjects [WS-		
PA]:		
Endpoint Policy Subject	•	Formatted: Bullets and Numbering
WS-PolicyAttachment defines a set of WSDL/1.1 policy attachment points for each of t	<u>he</u>	
above Policy Subjects. Since a WSCallback policy assertion specifies a concrete behavi it MUST NOT be attached to the abstract WSDL policy attachment points	<u>or,</u>	
The following is the list of WSDL/1.1 elements whose scope contains the Policy Subject	ts	
allowed for a WSCallback policy assertion but which MUST NOT have WSCallback polic	¥	
assertions attached:		
• wsdl:portType		Formatted: Bullets and Numbering
The following is the list of WSDL/1.1 elements whose scope contains the Policy Subject allowed for a WSCallback policy assertion and which MAY have WSCallback policy.	<u>ts</u>	
assertions attached:		
• wsdl:port	•	Formatted: Bullets and Numbering
• wsdl:binding		
5.2.4 Assertion Example		
The example below shows the use of the WSCallback policy assortion in a WSDI		
document.		
(01) <wsdl:definitions< td=""><td></td><td></td></wsdl:definitions<>		
(02) targetNamespace="example.com" (03) xmlps:tps="example.com"		
(04) xmlns:wsdl="http://schemas.xmlsoap.org/wsdl/"		
(06) xmlns:sca="http://docs.oasis-open.org/ns/opencsa/sca/200903"		
(07) xmlns:wsu="http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-		
(U9) <wsp:usingpolicy wsdl:required="true"></wsp:usingpolicy> (10)		
(11) <wsp:policy wsu:id="MyPolicy"></wsp:policy>		
(12) <sca:wscallback></sca:wscallback>		

400	
489	(14)
490	(15) omitted elements
491	(16)
492	(17) <wsdl:binding name="MyBinding" type="tns:MyPortType"></wsdl:binding>
493	<pre>(18) <wsp:policyreference uri="#MyPolicy"></wsp:policyreference></pre>
494	(19) omitted elements
495	(20)
496	(21)
497	(22)
108	
470	
499	Line (09) in the example above indicates that WS-Policy is in use as a required

extension. Lines (11-13) are a policy expression that includes a WSCallback policy assertion (line 12) to indicate that SCA Web Services Callback protocol must be used. Lines (17-20) are a WSDL binding. Line (18) indicates that the policy in lines (11-13) applies to this binding, specifically indicating that SCA Web Services Callback protocol must be used over all the messages in the binding.

505 5.2.5 Security Considerations

Policies and assertions SHOULD be signed to prevent tampering. Policies SHOULD NOT
 be accepted unless they are signed and have an associated security token to specify the
 signer has proper claims for the given policy. That is, a relying party shouldn't rely on a
 policy unless the policy is signed and presented with sufficient claims to pass the relying
 parties acceptance criteria.

511It should be noted that the mechanisms described in this document could be secured as512part of a SOAP message using WS-Security [WS-Security] or embedded within other513objects using object-specific security mechanisms.

Formatted: Bullets and Numbering

			Formatted: Bullets and Numbering
514	5 <u>6</u> Conformance	~	
515 516 517	The XML schema pointed to by the RDDL document at the namespace URI, defined by this specification, are considered to be authoritative and take precedence over the XML schema defined in the appendix of this document.		
518	There are two categories of artifacts for which this specification defines conformance:		
519	a) SCA WS Binding XML Document		
520	b) SCA Runtime		
521			
522	5.16.1 SCA WS Binding XML Document	-	Formatted: Bullets and Numbering
523 524 525	An SCA WS Binding XML document is an SCA Composite Document, or an SCA ComponentType Document, as defined by the SCA Assembly specification Section 13.1 [SCA-Assembly], that uses the <binding.ws> element.</binding.ws>		
526 527 528 529	An SCA WS Binding XML document MUST be a conformant SCA Composite Document or a SCA ComponentType Document, as defined by the SCA Assembly specification [SCA-ASSEMBLY], and MUST comply with all the applicable requirements specified in this specification.		
531	<u>5.26.2</u> SCA Runtime	•	Formatted: Bullets and Numbering
532 533	An implementation that claims to conform to the requirements of an SCA Runtime defined in this specification has to meet the following conditions:		
534 535 536	 The implementation MUST comply with all statements in Appendix XXX: Conformance Items related to an SCA Runtime, <u>except for those that originate</u> <u>from Section 5</u>, notably all "MUST" statements have to be implemented. 		
537 538 539 540	 The implementation MAY support the SCA Web Services Callback Protocol. If it does, it MUST comply with all statements in Appendix XXX: Conformance Items related to an SCA Runtime that originate in Section 5 except for those that originate in Section 5.1. 	•	Formatted: Bullets and Numbering
541 542 543 544	3. The implementation MAY support the SCA Web Services Callback Protocol in conjunction with support for WS-MakeConnection. If it does, it MUST comply with all statements in Appendix XXX: Conformance Items related to an SCA Runtime that originate in Section 5.		
545 546 547	2.4. The implementation MUST conform to the SCA Assembly Model Specification Version 1.1 [SCA-Assembly], and to the SCA Policy Framework Version 1.1 [SCA- Policy].	•	Formatted: Bullets and Numbering
548 549	3. <u>5.</u> The implementation MUST reject a SCA WS Binding XML Document that is not conformant per Section <u>6</u> 5.1.		
550 551			Comment [ask3]: Page: 16 Moved to the top of the section and modified to match the Java CAA wordings
			Comment [ask4]: Page: 16 Moved to section 5.1 and to section 2

612	B.C.Appendix - WSDL Generation	
613 614 615 616	Due to the number of factors that determine how a WSDL might be generated, including compatibility with existing WSDL uses, precise details cannot be specified. For example, implementation decisions can affect the way WSDL might be generated. For reference, and consistency, this section suggests non-normative choices for some of the various details involved in generating WSDL. For brevity, the following definitions apply:	
617 618	• component name = the value of the @name attribute of the component element containing the binding.ws element	
619 620	• service name = the value of the @name attribute of the service element containing the binding.ws element	
621 622	• binding name = the value of @name attribute of the binding.ws element, or the default if no @name attribute is present	
623	• SOAP version = either "SOAP11" or "SOAP12" as appropriate	
624	With those definitions in place, here are the suggested choices:	
625	• wsdl:definitions/@name = <component name=""> + "." + <service name=""></service></component>	
626	 wsdl:definitions/@targetNamespace = <structural for="" service="" the="" uri=""></structural> 	
627	• import each WSDL 1.1 portType, rather than putting them inline	
628	• wsdl:binding/@name = <binding name=""> + <soap version=""> + "Binding"</soap></binding>	
629	• wsdl:service/@name = <service name=""></service>	
630	• wsdl:port/@name = <binding name=""> + <soap version=""> + "Port"</soap></binding>

631	D. SCA Web Services Callback Protocol Message	
632	Fxamples	
032		
633	The message examples in this section are for a configuration that consists of a reference	
634	R that is wired to a Service S. S has a bidirectional interface and the binding used in hother service service service service and service ser	
635 636	interface and the callback interface both contain a single one-way operation.	
637	The following message exchanges take place between R and S:	
638	1. R invokes the forward operation and sets the callback address to RC1. Let's call	Formatted: Bullets and Numbering
639	the message that invokes the forward operation R1. S then calls the callback	
640	operation twice. Let's call the callback messages S1 and S2	
641	2. R invokes the forward operation again with the same callback address RC1. Let's	
642	call the message that invokes the forward operation R2. S then calls the callback	
643	operation once. Let's can the caliback message 55.	
644 645	3. R invokes the forward operation yet another time, but this time uses a difference callback address; PC2, Let's call the message that invokes the forward operation	
646	R3. S then calls the callback operation twice. Let's call the callback messages S4	
647	and S5.	
648	The messages R1, R2, R3, S1, S2, S3, S4 and S4 are listed below. The namespace	
649	prefix 'soap' can be bound to either the SOAP 1.1 or SOAP 1.2 namespace. The 'wsa'	
650	prefix is bound to the WS-Addressing 1.0 namespace.

D.1 Message Examples Using WS-MakeConnection	-	Tormacced. Builets and Numbering
In this case the reference R cannot host a listener and uses WS-MakeConnection to poll		
for callback requests. The interaction between the two consists of reference R sending a		
forward request R4. When using HTTP, the HTTP response to R4 contains an empty		
entity body. This is followed by a MakeConnection message from the reference to the		
service. This is a notling message from the reference and establishes a connection. If the		
sellback request is ready when the connection is established the scalar is a sender to		
caliback request is ready when the connection is established, the service sends a		
callback request S6 to the reference in the entity body of the HTTP response
