Abstract:

This specification (WS-ReliableMessaging) describes a protocol that allows messages to be delivered reliably between distributed applications in the presence of software component, system, or network failures. The protocol is described in this specification in a transport-independent manner allowing it to be implemented using different network technologies. To support interoperable Web services, a SOAP binding is defined within this specification.

The protocol defined in this specification depends upon other Web services specifications for the identification of service endpoint addresses and policies. How these are identified and retrieved are detailed within those specifications and are out of scope for this document.

By using the XML [XML], SOAP [SOAP 1.1], [SOAP 1.2] and WSDL [WSDL 1.1] extensibility model, SOAP-based and WSDL-based specifications are designed to be composed with each other to define a rich Web services environment. As such, WS-ReliableMessaging by itself does not define all the features required for a complete messaging solution. WS-ReliableMessaging is a building block that is used in conjunction with other specifications and application-specific protocols to accommodate a wide variety of protocols related to the operation of distributed Web services.

Status:

This document is a work in progress and will be updated to reflect issues as they are resolved by the Web Services Reliable Exchange (WS-RX) Technical Committee.

Table of Contents

1 Introduction

It is often a requirement for two Web services that wish to communicate to do so reliably in the presence of software component, system, or network failures. The primary goal of this specification is to create a modular mechanism for reliable delivery of messages. It defines a messaging protocol to identify, track, and manage the reliable delivery of messages between a source and a destination. It also defines a SOAP binding that is required for interoperability. Additional bindings may be defined.

This mechanism is extensible allowing additional functionality, such as security, to be tightly integrated. This specification integrates with and complements the WS-Security [WS-Security], WS-Policy [WS-Policy], and other Web services specifications. Combined, these allow for a broad range of reliable, secure messaging options.

1.1 Goals and Requirements

1.1.1 Requirements

1.2 Notational Conventions

The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [KEYWORDS].

This specification uses the following syntax to define normative outlines for messages:

- The syntax appears as an XML instance, but values in italics indicate data types instead of values.
- Characters are appended to elements and attributes to indicate cardinality:
    - "?" (0 or 1)
    - "*" (0 or more)
    - "+" (1 or more)
- The character "|" is used to indicate a choice between alternatives.
- The characters "[" and "]" are used to indicate that contained items are to be treated as a group with respect to cardinality or choice.
- An ellipsis (i.e. "...") indicates a point of extensibility that allows other child or attribute content specified in this document. Additional children elements and/or attributes MAY be added at the indicated extension points but they MUST NOT contradict the semantics of the parent and/or owner, respectively. If an extension is not recognized it SHOULD be ignored.
- XML namespace prefixes (See Section Namespace) are used to indicate the namespace of the element being defined.

1.3 Namespace

The XML namespace [XML-ns] URI that MUST be used by implementations of this specification is:

http://docs.oasis-open.org/ws-rx/wsrm/200604~~2~~

Dereferencing the above URI will produce the Resource Directory Description Language [RDDL 2.0] document that describes this namespace.

Table 1 lists the XML namespaces that are used in this specification. The choice of any namespace prefix is arbitrary and not semantically significant.

The following namespaces are used in this document:

Table 1

Prefix	Namespace
S	(Either SOAP 1.1 or 1.2)
S11	http://schemas.xmlsoap.org/soap/envelope/
S12	http://www.w3.org/2003/05/soap-envelope
wsrm	http://docs.oasis-open.org/ws-rx/wsrm/200604
wsa	http://www.w3.org/2005/08/addressing
xs	http://www.w3.org/2001/XMLSchema

The normative schema for WS-ReliableMessaging can be found at:

http://docs.oasis-open.org/ws-rx/wsrm/200604/wsrm-1.1-schema-200604~~2/wsrm-1.1~~.xsd

All sections explicitly noted as examples are informational and are not to be considered normative.

If an action IRI is used, and one is not already defined per the rules of the WS-Addressing specification [WS-Addressing], then the action IRI MUST consist of the WS-RM namespace URI concatenated with a '/', followed by the message element name. For example:

```
http://docs.oasis-open.org/ws-rx/wsrm/200604~~2~~/SequenceAcknowledgement
```

1.4 Compliance

An implementation is not compliant with this specification if it fails to satisfy one or more of the MUST or REQUIRED level requirements defined herein. A SOAP Node MUST NOT use the XML namespace identifier for this specification (listed in Section Namespace) within SOAP Envelopes unless it is compliant with this specification.

Normative text within this specification takes precedence over normative outlines, which in turn take precedence over the XML Schema [XML Schema Part 1, Part 2] descriptions.

2 Reliable Messaging Model

Many errors may interrupt a conversation. Messages may be lost, duplicated or reordered. Further the host systems may experience failures and lose volatile state.

The WS-ReliableMessaging specification defines an interoperable protocol that requires a Reliable Messaging (RM) Source and Reliable Messaging (RM) Destination to ensure that each message transmitted by the RM Source is successfully received by an RM Destination, or barring successful receipt, that an RM Source can, except in the most extreme circumstances, accurately determine the disposition of each message transmitted as perceived by the RM Destination, so as to resolve any in-doubt status. Note that this specification makes no restriction on the scope of the RM Source or RM Destination entities. For example, either may span multiple WSDL Ports or endpoints.

The protocol supports reliability features that enable ordered delivery, duplicate elimination, and guaranteed receipt for the RMD. It is expected that the AD and RMD will implement as many of these or as few of these characteristics as necessary to implement the AD. Regardless of which of the reliability features are employed,~~which include ordered delivery, duplicate elimination, and guaranteed receipt for the RMD. It is expected that the AD and RMD will implement as many of these or as few of these characteristics as necessary to implement the AD. In any case~~ the wire protocol does not change.

Figure 1 below illustrates the entities and events in a simple reliable exchange of messages. First, the Application Source Sends a message for reliable delivery. The Reliable Messaging (RM) Source accepts the message and Transmits it one or more times. After receiving the message, the RM Destination Acknowledges it. Finally, the RM Destination delivers the message to the Application Destination. The exact roles the entities play and the complete meaning of the events will be defined throughout this specification.

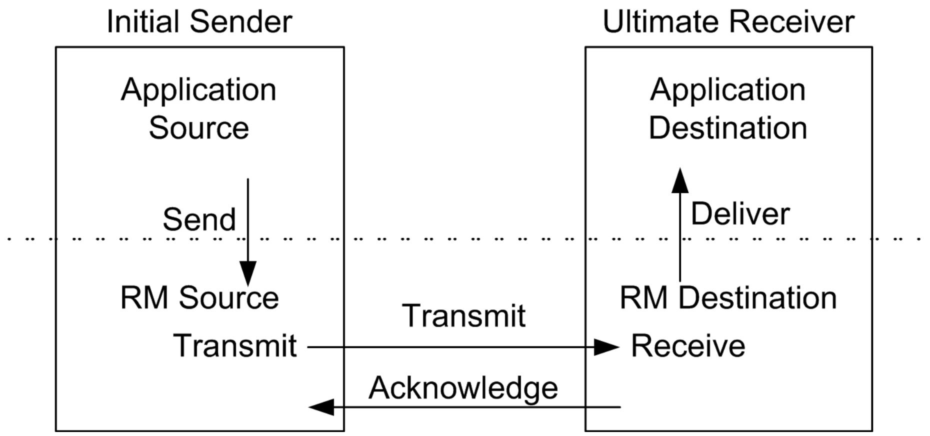

Figure 1: Reliable Messaging Model

2.1 Glossary

The following definitions are used throughout this specification:

Acknowledgement: The communication from the RM Destination to the RM Source indicating the successful receipt of a message.

Application Destination: The endpoint to which a message is Delivered.

Application Source: The endpoint that Sends a message.

Deliver: The act of transferring a message from the RM Destination to the Application Destination. The reliability guarantee is fulfilled at this point.

Endpoint: As defined in the WS-Addressing specification [WS-Addressing]; a Web service endpoint is a (referenceable) entity, processor, or resource to which Web service messages can be addressed. Endpoint references convey the information needed to address a Web service endpoint.

Receive: The act of reading a message from a network connection and qualifying it as relevant to RM Destination functions.

RM Destination: For any one reliably sent message the endpoint that receives the message.

RM Source: The endpoint that transmits the message.

Send: The act of submitting a message to the RM Source for reliable delivery. The reliability guarantee begins at this point.

Transmit: The act of writing a message to a network connection.

2.2 Protocol Preconditions

The correct operation of the protocol requires that a number of preconditions MUST be established prior to the processing of the initial sequenced message:

- For any single message exchange the RM Source MUST have an endpoint reference that uniquely identifies the RM Destination endpoint.
- The RM Source MUST have knowledge of the destination's policies, if any, and the RM Source MUST be capable of formulating messages that adhere to this policy.

If a secure exchange of messages is required, then the RM Source and RM Destination MUST have a security context.

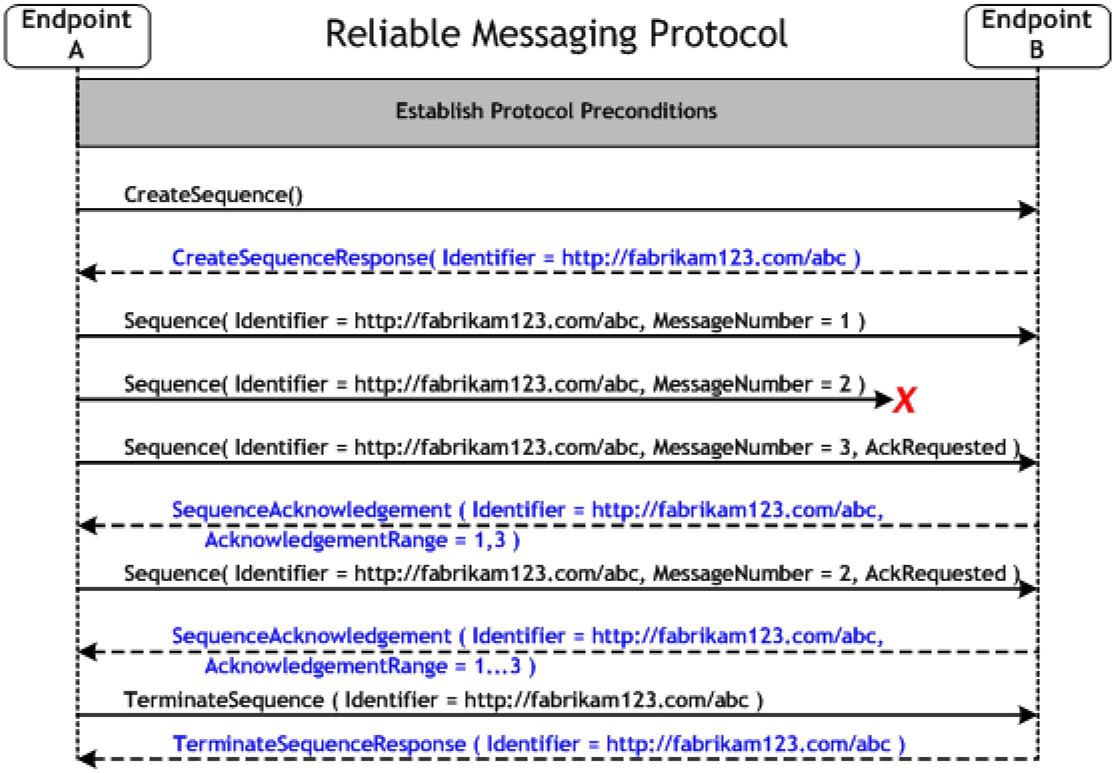
2.3 Protocol Invariants

During the lifetime of a Sequence, two invariants are REQUIRED for correctness:

- The RM Source MUST assign each message within a Sequence a message number (defined below) beginning at 1 and increasing by exactly 1 for each subsequent message. These numbers MUST be assigned in the same order in which messages are sent by the Application Source.
- Every acknowledgement issued by the RM Destination MUST include within an acknowledgement range or ranges the Sequence number of every message successfully received by the RM Destination and MUST exclude S~~sequence number of every message successfully received by the RM Destination and MUST exclude s~~equence numbers of any messages not yet received.

2.4 Example Message Exchange

Figure 2 illustrates a possible message exchange between two reliable messaging endpoints A and B.



Endpoint A
Reliable Messaging Protocol
Endpoint B
Establish Protocol Preconditions
CreateSequence()
CreateSequenceResponse(Identifier = http://fabrikam123.com/abc)
Sequence(Identifier = http://fabrikam123.com/abc, MessageNumber = 1)
Sequence(Identifier = http://fabrikam123.com/abc, MessageNumber = 2)
X
Sequence(Identifier = http://fabrikam123.com/abc, MessageNumber = 3, AckRequested)
SequenceAcknowledgement (Identifier = http://fabrikam123.com/abc, AcknowledgementRange = 1,3)
Sequence(Identifier = http://fabrikam123.com/abc, MessageNumber = 2, AckRequested)
SequenceAcknowledgement (Identifier = http://fabrikam123.com/abc, AcknowledgementRange = 1...3)
TerminateSequence (Identifier = http://fabrikam123.com/abc)
TerminateSequenceResponse (Identifier = http://fabrikam123.com/abc)

Figure 2: The WS-ReliableMessaging Protocol

1. The protocol preconditions are established. These include policy exchange, endpoint resolution, establishing trust.
2. The RM Source requests creation of a new Sequence.
3. The RM Destination creates a Sequence by returning a globally unique identifier.
4. The RM Source begins sending messages beginning with MessageNumber 1. In the figure above, the RM Source sends 3 messages.
5. Since the 3rd message is the last in this exchange, the RM Source includes a <wsrm:AckRequested> Header.
6. The 2nd message is lost in transit.
7. The RM Destination acknowledges receipt of message numbers 1 and 3 as a result of receiving the RM Source's `<wsrm:AckRequested>` Header.
8. The RM Source retransmits the 2nd message. This is a new message on the underlying transport, but it has the same S~~s~~equence identifier and message number so the RM Destination can recognize it as equivalent to the earlier message, in case both are received.
9. The RM Source includes an `<wsrm:AckRequested>` element so the RM Destination will expedite an acknowledgement.
10. The RM Destination receives the second transmission of the message with MessageNumber 2 and acknowledges receipt of message numbers 1, 2, and 3.
11. The RM Source receives this acknowledgement and sends a TerminateSequence message to the RM Destination indicating that the S~~s~~equence is completed and reclaims any resources associated with the Sequence.
12. The RM Destination receives the TerminateSequence message indicating that the RM Source will not be sending any more messages. The RM Destination sends a TerminateSequenceResponse message to the RM Source and and reclaims any resources associated with the Sequence.

The RM Source will expect to receive acknowledgements from the RM Destination during the course of a message exchange at occasions described in Section 3 below. Should an acknowledgement not be received in a timely fashion, the RM Source MUST re-transmit the request since either the request or the associated acknowledgement might~~ay~~ have been lost. Since the nature and dynamic characteristics of the underlying transport and potential intermediaries are unknown in the general case, the timing of re-transmissions cannot be specified. Additionally, over-aggressive re-transmissions have been demonstrated to cause transport or intermediary flooding which are counterproductive to the intention of providing a reliable exchange of messages. Consequently, implementers are encouraged to utilize adaptive mechanisms that dynamically adjust re-transmission time and the back-off intervals that are appropriate to the nature of the transports and intermediaries envisioned. For the case of TCP/IP transports, a mechanism similar to that described as RTTM in RFC 1323 [RTTM] should be considered.

Now that the basic model has been outlined, the details of the elements used in this protocol are now provided in Section 3.

3 RM Protocol Elements

The protocol elements define extensibility points at various places. Additional children elements and/or attributes MAY be added at the indicated extension points but MUST NOT contradict the semantics of the parent and/or owner, respectively. If a receiver does not recognize an extension, the receiver SHOULD ignore the extension.

3.1 Sequence Creation

The RM Source MUST request creation of an outbound Sequence by sending a `<wsrm:CreateSequence>` element in the body of a message to the RM Destination which in turn responds either with a message containing `<wsrm:CreateSequenceResponse>` or a `CreateSequenceRefused` fault. The `<wsrm:CreateSequence>` MAY carry an offer to create an inbound Sequence which is either accepted or rejected in the `<wsrm:CreateSequenceResponse>`. ~~sequence which is either accepted or rejected in the `<wsrm:CreateSequenceResponse>`. Note that offering a Sequence within the `<wsrm:CreateSequence>` element is simply a protocol optimization. There is no semantic difference between offering a Sequence, and choosing not to offer one and subsequently creating a new Sequence to carry messages from the RM Destination to the RM Source.~~

The SOAP version used for the CreateSequence message SHOULD be used for all subsequent messages in or for that Sequence, sent by either the RMS or the RMD.

The following exemplar defines the `<wsrm:CreateSequence>` syntax:

```
<wsrm:CreateSequence ...>
    <wsrm:AcksTo ...> wsa:EndpointReferenceType </wsrm:AcksTo>
    <wsrm:Expires ...> xs:duration </wsrm:Expires> ?
    <wsrm:Offer ...>
        <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
        <wsrm:Endpoint> wsa:EndpointReferenceType </wsrm:Endpoint>
        <wsrm:Expires ...> xs:duration </wsrm:Expires> ?
        ...
    </wsrm:Offer> ?
    ...
</wsrm:CreateSequence>
```

/wsrm:CreateSequence

This element requests creation of a new Sequence between the RM Source that sends it, and the RM Destination to which it is sent. This element MUST NOT be sent as a header block. The RM Destination MUST respond either with a `<wsrm:CreateSequenceResponse>` response message or a `CreateSequenceRefused` fault.

/wsrm:CreateSequence/wsrm:AcksTo

This REQUIRED element, of type wsa:EndpointReferenceType as specified by WS-Addressing [WS-Addressing] specifies the endpoint reference to which all `<wsrm:SequenceAcknowledgement>` messages and faults related to the created Sequence are to be sent, unless otherwise noted in this specification (for example, see Section 3.2).

Implementations MUST NOT use an endpoint reference in the AcksTo element that would prevent the sending of Sequence Acknowledgements back to the RM Source. For example, using the WS-Addressing "none" IRI would make it impossible for the RM Destination to ever send Sequence Acknowledgements.

/wsrm:CreateSequence/wsrm:Expires

This element, if present, of type `xs:duration` specifies the RM Source's requested duration for the Sequence. The RM Destination MAY either accept the requested duration or assign a lesser value of its choosing. A value of 'PT0S' indicates that the Sequence will never expire. Absence of the element indicates an implied value of 'PT0S'.

/wsrm:CreateSequence/wsrm:Expires/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

/wsrm:CreateSequence/wsrm:Offer

This element, if present, enables an RM Source to offer a corresponding Sequence for the reliable exchange of messages transmitted from RM Destination to RM Source.

/wsrm:CreateSequence/wsrm:Offer/wsrm:Identifier

This REQUIRED element MUST contain an absolute URI conformant with RFC3986 [URI] that uniquely identifies the offered Sequence.

/wsrm:CreateSequence/wsrm:Offer/wsrm:Identifier/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

/wsrm:CreateSequence/wsrm:Offer/wsrm:Endpoint

This REQUIRED element, of type wsa:EndpointReferenceType as specified by WS-Addressing [WSAddressing] specifies the endpoint reference to which WS-RM protocol messages related to the offered Sequence are to be sent.

/wsrm:CreateSequence/wsrm:Offer/wsrm:Expires

This element, if present, of type `xs:duration` specifies the duration for the Sequence. A value of 'PT0S' indicates that the Sequence will never expire. Absence of the element indicates an implied value of 'PT0S'.

/wsrm:CreateSequence/wsrm:Offer/wsrm:Expires/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

/wsrm:CreateSequence/wsrm:Offer/{any}

This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

/wsrm:CreateSequence/wsrm:Offer/@{any}

This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

/wsrm:CreateSequence/{any}

This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

/wsrm:CreateSequence/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

A <wsrm:CreateSequenceResponse> is sent in the body of a response message by an RM Destination in response to receipt of a <wsrm:CreateSequence> request message. It carries the <wsrm:Identifier> of the created Sequence and indicates that the RM Source may begin sending messages in the context of the identified Sequence.

The following exemplar defines the <wsrm:CreateSequenceResponse> syntax:

```
<wsrm:CreateSequenceResponse ...>
    <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
    <wsrm:Expires> xs:duration </wsrm:Expires> ?
    <wsrm:AcknowledgementInterval Milliseconds="xs:unsignedLong" ... /> ?
    <wsrm:Accept ...>
        <wsrm:AcksTo ...> wsa:EndpointReferenceType </wsrm:AcksTo>
        ...
    </wsrm:Accept> ?
    ...
</wsrm:CreateSequenceResponse>
```

/wsrm:CreateSequenceResponse

This element is sent in the body of the response message in response to a <wsrm:CreateSequence> request message. It indicates that the RM Destination has created a new Sequence at the request of the RM Source. This element MUST NOT be sent as a header block.

/wsrm:CreateSequenceResponse/wsrm:Identifier

This REQUIRED element MUST contain an absolute URI conformant with RFC3986 of the Sequence that has been created by the RM Destination.

/wsrm:CreateSequenceResponse/wsrm:Identifier/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

/wsrm:CreateSequenceResponse/wsrm:Expires

This element, if present, of type xs:duration accepts or refines the RM Source's requested duration for the Sequence. A value of 'PT0S' indicates that the Sequence will never expire. Absence of the element indicates an implied value of 'PT0S'. This value MUST be equal to or less than the value requested by the RM Source in the corresponding <wsrm:CreateSequence> message.

/wsrm:CreateSequenceResponse/wsrm:Expires/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

/wsrm:CreateSequenceResponse/wsrm:AcknowledgementInterval

This element, if present, specifies the duration after which the RM Destination will transmit an acknowledgement. If omitted, there is no implied value.

/wsrm:CreateSequenceResponse/wsrm:AcknowledgementInterval/@Milliseconds

The acknowledgement interval, specified in milliseconds.

/wsrm:CreateSequenceResponse/wsrm:AcknowledgementInterval/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

/wsrm:CreateSequenceResponse/wsrm:Accept

This element, if present, enables an RM Destination to accept the offer of a corresponding Sequence for the reliable exchange of messages transmitted from RM Destination to RM Source.

Note: If a `<wsrm:CreateSequenceResponse>` is returned without a child `<wsrm:Accept>` in response to a `<wsrm:CreateSequence>` that did contain a child `<wsrm:Offer>`, then the RM Source MAY immediately reclaim any resources associated with the unused offered Sequence.

/wsrm:CreateSequenceResponse/wsrm:Accept/wsrm:AcksTo

This REQUIRED element, of type wsa:EndpointReferenceType as specified by WS-Addressing [WS-Addressing], specifies the endpoint reference to which `<wsrm:SequenceAcknowledgement>` messages related to the accepted Sequence are to be sent.

/wsrm:CreateSequenceResponse/wsrm:Accept/{any}

This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

/wsrm:CreateSequenceResponse/wsrm:Accept/@{any}

This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

/wsrm:CreateSequenceResponse/{any}

This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

/wsrm:CreateSequenceResponse/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

3.2 Closing A Sequence

There may be times during the use of an RM Sequence that the RM Source or RM Destination will wish to discontinue using a Sequence. Simply terminating the Sequence discards the state managed by the RM Destination, leaving the RM Source unaware of the final ranges of messages that were successfully delivered to the RM Destination. To ensure that the Sequence ends with a known final state both the RM Source and RM Destination may choose to close the Sequence before terminating it.

If the RM Source wishes to close the Sequence, then it sends a `<wsrm:CloseSequence>` element, in the body of a message, to the RM Destination. This message indicates that the RM Destination MUST NOT receive any new messages for the specified Sequence, other than those already received at the time the `<wsrm:CloseSequence>` element is interpreted by the RMD. Upon receipt of this message, or subsequent to the RM Destination closing the Sequence of its own volition, the RM Destination MUST include a final SequenceAcknowledgement (that MUST include the <wsrm:Final> element) header block on any messages associated with the Sequence destined to the RM Source, including the CloseSequenceResponse message or ~~then it sends a `<wsrm:CloseSequence>` element, in the body of a message, to the RM Destination. This message indicates that the RM Destination MUST NOT receive any new messages for the specified sequence, other than those already received at the time the `<wsrm:CloseSequence>` element is interpreted by the RMD. Upon receipt of this message, or subsequent to the RM Destination closing the Sequence of its own volition, the RM Destination MUST include a final SequenceAcknowledgement (that MUST include the <wsrm:Final> element) header block on each message destined to the RM Source, including the CloseSequenceResponse message and~~ on any Sequence Fault transmitted to the RMS.

While the RM Destination MUST NOT receive any new messages for the specified Sequence it MUST still process RM protocol messages. For example, it MUST respond to AckRequested, TerminateSequence as well as CloseSequence messages. Note, subsequent CloseSequence messages have no effect on the state of the S~~sequence it MUST still process RM protocol messages. For example, it MUST respond to AckRequested, TerminateSequence as well as CloseSequence messages. Note, subsequent CloseSequence messages have no effect on the state of the s~~equence.

In the case where the RM Destination wishes to discontinue use of a Sequence it is RECOMMENDED that it close the Sequence~~sequence it may close the sequence itself~~. Please see <wsrm:Final> and the SequenceClosed fault. Whenever possible the SequenceClosed Fault SHOULD be used in place of the SequenceTerminated Fault, whenever possible, to allow the RM Source to still receive Acknowledgements.

The following exemplar defines the CloseSequence syntax:

```
<wsrm:CloseSequence ...>
    <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
    ...
</wsrm:CloseSequence>
```

/wsrm:CloseSequence

This element is sent by an RM Source to indicate that the RM Destination MUST NOT receive any new messages for this Sequence. A SequenceClosed fault MUST be generated by the RM Destination when it receives a message for a S~~sequence. A SequenceClosed fault MUST be generated by the RM Destination when it receives a message for a s~~equence that is closed.

/wsrm:CloseSequence/wsrm:Identifier

This REQUIRED element MUST contain an absolute URI conformant with RFC3986 of the Sequence that is being closed.

/wsrm:CloseSequence/wsrm:Identifier/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

/wsrm:CloseSequence/{any}

This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

/wsrm:CloseSequence@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

A <wsrm:CloseSequenceResponse> is sent in the body of a response message by an RM Destination in response to receipt of a <wsrm:CloseSequence> request message. It indicates that the RM Destination has closed the S~~s~~equence.

The following exemplar defines the <wsrm:CloseSequenceResponse> syntax:

```
<wsrm:CloseSequenceResponse ...>
    <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
    ...
</wsrm:CloseSequenceResponse>
```

/wsrm:CloseSequenceResponse

This element is sent in the body of a response message by an RM Destination in response to receipt of a <wsrm:CloseSequence> request message. It indicates that the RM Destination has closed the S~~s~~equence.

/wsrm:CloseSequenceResponse/wsrm:Identifier

This REQUIRED element MUST contain an absolute URI conformant with RFC3986 of the Sequence that is being terminated.

/wsrm:CloseSequenceResponse/wsrm:Identifier/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

/wsrm:CloseSequenceResponse/{any}

This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

/wsrm:CloseSequenceResponse@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

3.3 Sequence Termination

When the RM Source has completed its use of the Sequence it sends a <wsrm:TerminateSequence> element, in the body of a message, to the RM Destination to indicate that the Sequence is complete and that it will not be sending any further messages related to the Sequence. The RM Destination can safely reclaim any resources associated with the Sequence upon receipt of the <wsrm:TerminateSequence> message. Under normal usage the RM Source will complete its use of the S~~source will complete its use of the s~~equence when all of the messages in the Sequence have been acknowledged. However, the RM Source is free to Terminate or Close a Sequence at any time regardless of the acknowledgement state of the messages.

The following exemplar defines the TerminateSequence syntax:

```
<wsrm:TerminateSequence ...>
    <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
    ...
</wsrm:TerminateSequence>
```

/wsrm:TerminateSequence

This element is sent by an RM Source to indicate it has completed its use of the Sequence. It indicates that the RM Destination can safely reclaim any resources related to the identified Sequence. This element MUST NOT be sent as a header block. The RM Source MAY retransmit this element. Once this element is sent, other than this element, the RM Source MUST NOT send any additional message to the RM Destination referencing this S~~s~~equence.

/wsrm:TerminateSequence/wsrm:Identifier

This REQUIRED element MUST contain an absolute URI conformant with RFC3986 of the Sequence that is being terminated.

/wsrm:TerminateSequence/wsrm:Identifier/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

/wsrm:TerminateSequence/{any}

This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

/wsrm:TerminateSequence/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

A <wsrm:TerminateSequenceResponse> is sent in the body of a response message by an RM Destination in response to receipt of a <wsrm:TerminateSequence> request message. It indicates that the RM Destination has terminated the S~~s~~equence.

The following exemplar defines the <wsrm:TerminateSequenceResponse> syntax:

```
<wsrm:TerminateSequenceResponse ...>
    <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
    ...
</wsrm:TerminateSequenceResponse>
```

/wsrm:TerminateSequenceResponse

This element is sent in the body of a response message by an RM Destination in response to receipt of a <wsrm:TerminateSequence> request message. It indicates that the RM Destination has terminated the sequence. This element MUST NOT be sent as a header block.

/wsrm:TerminateSequenceResponse/wsrm:Identifier

This REQUIRED element MUST contain an absolute URI conformant with RFC3986 of the Sequence that is being terminated.

/wsrm:TerminateSequenceResponse/wsrm:Identifier/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

/wsrm:TerminateSequenceResponse/{any}

This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

/wsrm:TerminateSequenceResponse/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

On receipt of a <wsrm:TerminateSequence> message an RM Destination MUST respond with a corresponding <wsrm:TerminateSequenceResponse> message or generate a fault.

3.4 Sequences

The RM protocol uses a <wsrm:Sequence> header block to track and manage the reliable delivery of messages. Messages for which a reliable delivery is required MUST contain a <wsrm:Sequence> header block. Each Sequence MUST have a unique <wsrm:Identifier> element and each message within a Sequence MUST have a <wsrm:MessageNumber> element that increments by 1 from an initial value of 1. These values are contained within a <wsrm:Sequence> header block accompanying each message being delivered in the context of a Sequence.

There MUST be no more than one <wsrm:Sequence> header block in any message.

A following exemplar defines its syntax:

```
<wsrm:Sequence ...>
    <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
    <wsrm:MessageNumber> wsrm:MessageNumberType </wsrm:MessageNumber>
    ...
</wsrm:Sequence>
```

The following describes the content model of the Sequence header block.

/wsrm:Sequence

This protocol element associates the message in which it is contained with a previously established RM Sequence. It contains the Sequence's unique identifier and the containing message's ordinal position within that Sequence~~is the element containing Sequence information for WS-ReliableMessaging~~. The <wsrm:Sequence> element MUST be understood by the RM Destination. The `<wsrm:Sequence>` element MUST have a `mustUnderstand` attribute with a value 1/true from the namespace corresponding to the version of SOAP to which the `<wsrm:Sequence>` SOAP header block is bound.

/wsrm:Sequence/wsrm:Identifier

This REQUIRED element MUST contain an absolute URI conformant with RFC3986 that uniquely identifies the Sequence.

/wsrm:Sequence/wsrm:Identifier/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

/wsrm:Sequence/wsrm:MessageNumber

This REQUIRED element MUST contain a `wsrm:MessageNumberType` representing the ordinal position of the message within a Sequence. Sequence MessageNumbers start at 1 and monotonically increase throughout the Sequence. If the message number exceeds the internal limitations of an RM Source or RM Destination or reaches the maximum value of 9,223,372,036,854,775,807 the RM Source or Destination MUST generat~~issu~~e a MessageNumberRollover fault.

/wsrm:Sequence/{any}

This is an extensibility mechanism to allow different types of information, based on a schema, to be passed.

/wsrm:Sequence/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

The following example illustrates a Sequence header block.

```
<wsrm:Sequence>
    <wsrm:Identifier>http://example.com/abc</wsrm:Identifier>
    <wsrm:MessageNumber>10</wsrm:MessageNumber>
</wsrm:Sequence>
```

3.5 Request Acknowledgement

The purpose of the `<wsrm:AckRequested>` header block is to signal to the RM Destination that the RM Source is requesting that a `<wsrm:SequenceAcknowledgement>` be sent.

The RM Source MAY request an acknowledgement message from the RM Destination at any time by including an <wsrm:AckRequested> header block in any message targeted to the RM Destination. An RM Destination that receives a message that contains an <wsrm:AckRequested> header block MUST send a message containing a <wsrm:SequenceAcknowledgement> header block to the wsrm:AcksTo endpoint reference (see Section 3.1). If a non-mustUnderstand fault occurs when processing an RM Header that was piggy-backed on another message, a fault MUST be generated, but the processing of the original message MUST NOT be affected. It is RECOMMENDED that the RMD return a <wsrm:AcknowledgementRange> or <wsrm:None> element instead of a <wsrm:Nack> element (see below). ~~may request an acknowledgement message from the RM Destination at any time by including an <wsrm:AckRequested> header block in any message targeted to the RM Destination. An RM Destination that receives a message that contains an <wsrm:AckRequested> header block MUST send a message containing a <wsrm:SequenceAcknowledgement> header block to the wsrm:AcksTo endpoint reference (see Section 3.1). If a non-mustUnderstand fault occurs when processing an RM Header that was piggy-backed on another message, a fault MUST be generated, but the processing of the original message MUST NOT be affected.~~

The following exemplar defines its syntax:

```
<wsrm:AckRequested ...>
    <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>

    ...
</wsrm:AckRequested>
```

/wsrm:AckRequested

This element requests an acknowledgement for the identified S~~s~~equence.

/wsrm:AckRequested/wsrm:Identifier

This REQUIRED element MUST contain an absolute URI, conformant with RFC3986, that uniquely identifies the Sequence to which the request applies.

/wsrm:AckRequested/wsrm:Identifier/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

/wsrm:AckRequested/{any}

This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

/wsrm:AckRequested/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

3.6 Sequence Acknowledgement

The RM Destination informs the RM Source of successful message receipt using a <wsrm:SequenceAcknowledgement> header block. The <wsrm:SequenceAcknowledgement> header block MAY be transmitted independently or included on any message targeted to the AcksTo EPR. The RM Destination MAY send a <wsrm:SequenceAcknowledgement> header block at any point during which the S~~. The RM Destination MAY send a <wsrm:SequenceAcknowledgement> header block at any point during which the s~~equence is valid. Acknowledgements can be explicitly requested using the <wsrm:AckRequested> directive (see Section Request Acknowledgement). If a non-mustUnderstand fault occurs when processing an RM Header that was piggy-backed on another message, a fault MUST be generated, but the processing of the original message MUST NOT be affected.

A RMD MAY include a wsrm:SequenceAcknowledgement header block on any SOAP envelope targetted to the endpoint referenced by the wsrm:AcksTo EPR. This concept is often referred to as "piggy-backing" Sequence acknowledgements.

A wsrm:AcksTo EPR MAY specify the WS-Addressing anonymous IRI as its address. When the wsrm:AcksTo EPR specifies the WS-Addressing anonymous IRI as its address, the RM Destination MUST transmit any wsrm:SequenceAcknowledgement headers for the created Sequence in a SOAP envelope to be transmitted on the protocol binding-specific channel. Such a channel is provided by the context of a received message containing a SOAP envelope that contains a wsrm:Sequence header block and/or a wsrm:AckRequested header block for that same Sequence identifier.

The following exemplar defines its syntax:

```
<wsrm:SequenceAcknowledgement ...>
    <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
    [ [ [ <wsrm:AcknowledgementRange ...
            Upper="wsrm:MessageNumberType"
            Lower="wsrm:MessageNumberType"/> +

        | <wsrm:None/> ]
        <wsrm:Final/> ? ]
    | <wsrm:Nack> wsrm:MessageNumberType </wsrm:Nack> + ]

    ...
</wsrm:SequenceAcknowledgement>
```

The following describes the content model of the `<wsrm:SequenceAcknowledgement>` header block.

/wsrm:SequenceAcknowledgement

This element contains the Sequence acknowledgement information.

/wsrm:SequenceAcknowledgement/wsrm:Identifier

This REQUIRED element MUST contain an absolute URI conformant with RFC3986 that uniquely identifies the Sequence. A message MUST NOT contain multiple <SequenceAcknowledgement> header blocks that share the same value for <Identifier>.

/wsrm:SequenceAcknowledgement/wsrm:Identifier/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

/wsrm:SequenceAcknowledgement/wsrm:AcknowledgementRange

This OPTIONAL element, if present, can occur 1 or more times. It contains a range of Sequence MessageNumbers successfully received by the RM Destination. The ranges SHOULD NOT overlap. This element MUST NOT be present if a sibling `<wsrm:Nack>` or `<wsrm:None>` element is also present as a child of `<wsrm:SequenceAcknowledgement>`.

/wsrm:SequenceAcknowledgement/wsrm:AcknowledgementRange/@Upper

This REQUIRED attribute contains a `wsrm:MessageNumberType` representing the `<wsrm:MessageNumber>` of the highest contiguous message in a Sequence range received by the RM Destination.

/wsrm:SequenceAcknowledgement/wsrm:AcknowledgementRange/@Lower

This REQUIRED attribute contains a wsrm:MessageNumberType representing the <wsrm:MessageNumber> of the lowest contiguous message in a Sequence range received by the RM Destination.

/wsrm:SequenceAcknowledgement/wsrm:AcknowledgementRange/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

/wsrm:SequenceAcknowledgement/wsrm:Final

This OPTIONAL element, if present, indicates that the RM Destination is not receiving new messages for the specified Sequence. The RM Source can be assured that the ranges of messages acknowledged by this SequenceAcknowledgement header block will not change in the future. This element MUST be present when the Sequence is closed. Note: this element MUST NOT be used when sending a Nack, it can only be used when sending AcknowledgementRanges or <wsrm:None>.

/wsrm:SequenceAcknowledgement/wsrm:Nack

This OPTIONAL element, if present, MUST contain a wsrm:MessageNumberType representing the <wsrm:MessageNumber> of an unreceived message in a Sequence. Th~~is element permits the gap analysis of the <wsrm:AcknowledgementRange> elements to be performed at the RM Destination rather than at the RM Source which may yield performance benefits in certain environments. Th~~e <wsrm:Nack> element MUST NOT be present if a sibling <wsrm:AcknowledgementRange> or <wsrm:None> element is also present as a child of <wsrm:SequenceAcknowledgement>. Upon the receipt of a Nack, an RM Source SHOULD retransmit the message identified by the Nack. The RM Destination MUST NOT issue a <wsrm:SequenceAcknowledgement> containing a <wsrm:Nack> for a message that it has previously acknowledged within a <wsrm:AcknowledgementRange>. The RM Source SHOULD ignore a <wsrm:SequenceAcknowledgement> containing a <wsrm:Nack> for a message that has previously been acknowledged within a <wsrm:AcknowledgementRange>.

/wsrm:SequenceAcknowledgement/wsrm:None

This OPTIONAL element, if present, MUST be used when the RM Destination has not received any messages for the specified S~~s~~equence. The <wsrm:None> element MUST NOT be present if a sibling <wsrm:AcknowledgementRange> or <wsrm:Nack> element is also present as a child of the <wsrm:SequenceAcknowledgement>.

/wsrm:SequenceAcknowledgement/{any}

This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

/wsrm:SequenceAcknowledgement/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

The following examples illustrate <wsrm:SequenceAcknowledgement> elements:

- Message numbers 1...10 inclusive in a Sequence have been received by the RM Destination.

```
<wsrm:SequenceAcknowledgement>
        <wsrm:Identifier>http://example.com/abc</wsrm:Identifier>
        <wsrm:AcknowledgementRange Upper="10" Lower="1"/>
</wsrm:SequenceAcknowledgement>
```

- Message numbers 1..2, 4..6, and 8..10 inclusive in a Sequence have been received by the RM Destination, messages 3 and 7 have not been received.

```
<wsrm:SequenceAcknowledgement>
        <wsrm:Identifier>http://example.com/abc</wsrm:Identifier>
        <wsrm:AcknowledgementRange Upper="2" Lower="1"/>
        <wsrm:AcknowledgementRange Upper="6" Lower="4"/>
        <wsrm:AcknowledgementRange Upper="10" Lower="8"/>
</wsrm:SequenceAcknowledgement>
```

- Message number 3 in a Sequence has not been received by the RM Destination.

```
<wsrm:SequenceAcknowledgement>
        <wsrm:Identifier>http://example.com/abc</wsrm:Identifier>
        <wsrm:Nack>3</wsrm:Nack>
</wsrm:SequenceAcknowledgement>
```

4 Faults

The faults defined in this section fall into one of two categories; those faults that are the result of messages or operations within a specific Sequence and those faults that are not. By their nature the CreateSequenceRefused, UnknownSequence, and WSRMRequired faults cannot be correlated with a Sequence. All other faults defined in this section relate to the processing of WS-RM protocol messages or messages containing WS-RM header blocks targeted at a specific Sequence and are collectively referred to as "Sequence faults"~~ definitions defined in this section reference certain abstract properties, such as [fault endpoint], that are defined in section 3 of the WS-Addressing [WS-Addressing] specification. Endpoints compliant with this specification MUST include required Message Addressing Properties on all fault messages~~.

Faults for the CreateSequence message exchange are treated as defined in WS-Addressing. CreateSequenceRefused is a possible fault reply for this operation. UnknownSequence is a fault generated by endpoints when messages carrying RM header blocks targeted at unrecognized or terminated Sequences are detected, these faults are also treated as defined in WS-Addressing. All other faults in this section relate to the processing of RM header blocks targeted at known Sequences and are collectively referred to as S~~sequences are detected, these faults are also treated as defined in WS-Addressing. All other faults in this section relate to the processing of RM header blocks targeted at known sequences and are collectively referred to as s~~equence faults. Sequence faults SHOULD be sent to the same [destination] as `<wsrm:SequenceAcknowledgement>` messages. These faults are correlated using the Sequence identifier carried in the detail.

WS-ReliableMessaging faults MUST include as the [action] property the default fault action IRI defined in the version of WS-Addressing used in the message. The value from the current version is below for informational purposes:

```
http://schemas.xmlsoap.org/ws/2004/08/addressing/fault
```

The faults defined in this section are generated if the condition stated in the preamble is met. Fault handling rules are defined in section 4 of WS-Addressing.

The definitions of faults use the following properties:

[Code] The fault code.

[Subcode] The fault subcode.

[Reason] The English language reason element.

[Detail] The detail element. If absent, no detail element is defined for the fault.

The [Code] property MUST be either "Sender" or "Receiver". These properties are serialized into text XML as follows:

SOAP Version	Sender	Receiver
SOAP 1.1	S11:Client	S11:Server
SOAP 1.2	S:Sender	S:Receiver

The properties above bind to a SOAP 1.2 fault as follows:

```
<S:Envelope>
 <S:Header>
   <wsa:Action>
      http://schemas.xmlsoap.org/ws/2004/08/addressing/fault
   </wsa:Action>
   <!-- Headers elided for clarity.  -->
 </S:Header>
 <S:Body>
  <S:Fault>
   <S:Code>
     <S:Value> [Code] </S:Value>
     <S:Subcode>
      <S:Value> [Subcode] </S:Value>
     </S:Subcode>
   </S:Code>
   <S:Reason>
     <S:Text xml:lang="en"> [Reason] </S:Text>
   </S:Reason>
   <S:Detail>
     [Detail]
          ...
   </S:Detail>
  </S:Fault>
 </S:Body>
</S:Envelope>
```

The properties above bind to a SOAP 1.1 fault as follows when the fault is triggered by processing an RM header block:

```
<S11:Envelope>
 <S11:Header>
   <wsrm:SequenceFault>
     <wsrm:FaultCode> wsrm:FaultCodes </wsrm:FaultCode>
     <wsrm:Detail> [Detail] </wsrm:Detail>
     ...
   </wsrm:SequenceFault>
   <!-- Headers elided for clarity.  -->
 </S11:Header>
 <S11:Body>
  <S11:Fault>
   <faultcode> [Code] </faultcode>
   <faultstring> [Reason] </faultstring>
  </S11:Fault>
 </S11:Body>
</S11:Envelope>
```

The properties bind to a SOAP 1.1 fault as follows when the fault is generated as a result of processing a `<wsrm:CreateSequence>` request message:

```
<S11:Envelope>
 <S11:Body>
  <S11:Fault>
   <faultcode> [Subcode] </faultcode>
   <faultstring> [Reason] </faultstring>
  </S11:Fault>
 </S11:Body>
</S11:Envelope>
```

4.1 SequenceFault Element

The purpose of the `<wsrm:SequenceFault>` element is to carry the specific details of a fault generated during the reliable messaging specific processing of a message belonging to a Sequence. The `<wsrm:SequenceFault>` container MUST only be used in conjunction with the SOAP 1.1 fault mechanism. It MUST NOT be used in conjunction with the SOAP ~~1.1 fault mechanism. It MUST NOT be used in conjunction with the SOAP~~1.2 binding.

The following exemplar defines its syntax:

```
<wsrm:SequenceFault ...>
  <wsrm:FaultCode> wsrm:FaultCodes </wsrm:FaultCode>
  <wsrm:Detail> ... </wsrm:Detail> ?
  ...
</wsrm:SequenceFault>
```

The following describes the content model of the `SequenceFault` element.

/wsrm:SequenceFault

This is the element containing Sequence information for WS-ReliableMessaging

/wsrm:SequenceFault/wsrm:FaultCode

This element, if present, MUST contain a qualified name from the set of fault [Subcodes] defined below.

/wsrm:SequenceFault/wsrm:Detail

This optional element is intended for carrying application specific error information related to the fault being described.

/wsrm:SequenceFault/wsrm:Detail/{any}

The application specific error information related to the fault being described.

/wsrm:SequenceFault/wsrm:Detail/@{any}

The application specific error information related to the fault being described.

/wsrm:SequenceFault/{any}

This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

/wsrm:SequenceFault/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

4.2 Sequence Terminated

This fault is generated by either the RM Source or the RM Destination to indicate that it has either encountered an unrecoverable condition, or has detected a violation of the protocol and as a consequence, has chosen to terminate the S~~sent by either the RM Source or the RM Destination to indicate that it has either encountered an unrecoverable condition, or has detected a violation of the protocol and as a consequence, has chosen to terminate the s~~equence. The endpoint that generates this fault should make every reasonable effort to notify the corresponding endpoint of this decision.

Receipt of SequenceTerminated by either the RMD or the RMS shall terminate the S~~s~~equence if it is not otherwise terminated.

Properties:

[Code] Sender or Receiver

[Subcode] wsrm:SequenceTerminated

[Reason] The Sequence has been terminated due to an unrecoverable error.

[Detail]

```
<wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
```

4.3 Unknown Sequence

This fault is generated by either the RM Source or the RM Destination in response to a message containing an unknown or terminated Sequence identifier. Receipt of UnknownSequence by either the RMD or the RMS shall terminate the S~~sent by either the RM Source or the RM Destination in response to a message containing an unknown or terminated sequence identifier. Receipt of UnknownSequence by either the RMD or the RMS shall terminate the s~~equence if it is not otherwise terminated.

Properties:

[Code] Sender

[Subcode] wsrm:UnknownSequence

[Reason] The value of wsrm:Identifier is not a known Sequence identifier.

[Detail]

```
<wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
```

4.4 Invalid Acknowledgement

This fault is generated~~sent~~ by the RM Source in response to a `<wsrm:SequenceAcknowledgement>` that violates the cumulative acknowledgement invariant. An example of such a violation would be a SequenceAcknowledgement covering messages that have not been sent.

[Code] Sender

[Subcode] wsrm:InvalidAcknowledgement

[Reason] The SequenceAcknowledgement violates the cumulative acknowledgement invariant.

[Detail]

```
<wsrm:SequenceAcknowledgement ...> ... </wsrm:SequenceAcknowledgement>
```

4.5 Message Number Rollover

This fault is generated to indicate that message numbers for a S~~sent to indicate that message numbers for a s~~equence have been exhausted.

Properties:

[Code] Sender

[Subcode] wsrm:MessageNumberRollover

[Reason] The maximum value for wsrm:MessageNumber has been exceeded.

[Detail]

```
<wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
```

4.6 Create Sequence Refused

This fault is generated in response to a create S~~sent in response to a create s~~equence request that cannot be satisfied.

Properties:

[Code] Sender

[Subcode] wsrm:CreateSequenceRefused

[Reason] The create S~~s~~equence request has been refused by the RM Destination.

[Detail]

```
xs:any
```

4.7 Sequence Closed

This fault is generated by an RM Destination to indicate that the specified Sequence has been closed. This fault MUST be generated when an RM Destination is asked to receive a message for a S~~sent by an RM Destination to indicate that the specified sequence has been closed. This fault MUST be generated when an RM Destination is asked to receive a message for a s~~equence that is closed.

Properties:

[Code] Sender

[Subcode] wsrm:SequenceClosed

[Reason] The S~~s~~equence is closed and can not receive new messages.

[Detail]

```
<wsrm:Identifier...> xs:anyURI </wsrm:Identifier>
```

4.8 WSRM Required

If an RM Destination requires the use of WS-RM, this fault is generated when it receives an incoming message that did not use this protocol.

Properties:

[Code] Sender

[Subcode] wsrm:WSRMRequired

[Reason] The RM Destination requires the use of WSRM.

[Detail]

```
xs:any
```

5 Security Considerations

It is strongly recommended that the communication between services be secured using the mechanisms described in WS-Security. In order to properly secure messages, the body and all relevant headers need to be included in the signature. Specifically, the `<wsrm:Sequence>` header needs to be signed with the body in order to "bind" the two together. The `<wsrm:SequenceAcknowledgement>` header may be signed independently because a reply independent of the message is not a security concern.

Because Sequences are expected to exchange a number of messages, it is recommended that a security context be established using the mechanisms described in WS-Trust[Trust] and WS-SecureConversation [SecureConversation]. If a Sequence is bound to a specific destination, then the security context needs to be established or shared with the destination servicing the Sequence. While the context can be established at any time, it is critical that the messages establishing the Sequence be secured even if they precede security context establishment. However, it is recommended that the security context be established first. Security contexts are independent of reliable messaging Sequences. Consequently, security contexts can come and go independent of the lifetime of the Sequence. In fact, it is recommended that the lifetime of a security context be less than the lifetime of the Sequence unless the Sequence is very short-lived.

It is common for message Sequences to exchange a number of messages (or a large amount of data). As a result, the usage profile of a Sequence is such that it is susceptible to key attacks. For this reason it is strongly recommended that the keys be changed frequently. This "re-keying" can be effected a number of ways. The following list outlines four common techniques:

- Closing and re-establishing a security context
- Exchanging new secrets between the parties
- Using a derived key sequence and switch "generations"
- Attaching a nonce to each message and using it in a derived key function with the shared secret

The security context may be re-established using the mechanisms described in WS-Trust and WS-SecureConversation. Similarly, secrets can be exchanged using the mechanisms described in WS-Trust. Note, however, that the current shared secret should not be used to encrypt the new shared secret. Derived keys, the preferred solution from this list, can be specified using the mechanisms described in WS-SecureConversation.

There is a core tension between security and reliable messaging that can be problematic if not considered in implementations. That is, one aspect of security is to prevent message replay and the core tenet of reliable messaging is to replay messages until they are acknowledged. Consequently, if the security sub-system processes a message but a failure occurs before the reliable messaging sub-system records the message (or the message is considered "processed"), then it is possible (and likely) that the security sub-system will treat subsequent copies as replays and discard them. At the same time, the reliable messaging sub-system will likely continue to expect and even solicit the missing message(s). Care should be taken to avoid and prevent this rare condition.

The following list summarizes common classes of attacks that apply to this protocol and identifies the mechanism to prevent/mitigate the attacks:

- **Message alteration** – Alteration is prevented by including signatures of the message information using WS-Security.
- **Message disclosure** – Confidentiality is preserved by encrypting sensitive data using WS-Security.

- **Key integrity** – Key integrity is maintained by using the strongest algorithms possible (by comparing secured policies – see WS-Policy and WS-SecurityPolicy).
- **Authentication** – Authentication is established using the mechanisms described in WS-Security and WS-Trust. Each message is authenticated using the mechanisms described in WS-Security.
- **Accountability** – Accountability is a function of the type of and string of the key and algorithms being used. In many cases, a strong symmetric key provides sufficient accountability. However, in some environments, strong PKI signatures are required.
- **Availability** – All reliable messaging services are subject to a variety of availability attacks. Replay detection is a common attack and it is recommended that this be addressed by the mechanisms described in WS-Security. (Note that because of legitimate message replays, detection should include a differentiator besides message id such as a timestamp). Other attacks, such as network-level denial of service attacks are harder to avoid and are outside the scope of this specification. That said, care should be taken to ensure that minimal state is saved prior to any authenticating S~~s~~equences.

B.2 Initial Transmission

The following example WS-ReliableMessaging headers illustrate the message exchange in the above figure. The three messages have the following headers; the third message is identified as the last message in the S~~s~~equence:

Message 1

```
<?xml version="1.0" encoding="UTF-8"?>
<S:Envelope xmlns:S="http://www.w3.org/2003/05/soap-envelope"
xmlns:wsrm="http://docs.oasis-open.org/ws-rx/wsrm/200604~~2~~"
xmlns:wsa="http://www.w3.org/2005~~schemas.xmlsoap.org/ws/2004~~/08/addressing">
  <S:Header>
    <wsa:MessageID>
      http://Business456.com/guid/71e0654e-5ce8-477b-bb9d-34f05cfcbc9e
    </wsa:MessageID>
    <wsa:To>http://example.com/serviceB/123</wsa:To>
    <wsa:From>
      <wsa:Address>http://Business456.com/serviceA/789</wsa:Address>
    </wsa:From>
    <wsa:Action>http://example.com/serviceB/123/request</wsa:Action>
    <wsrm:Sequence>
      <wsrm:Identifier>http://Business456.com/RM/ABC</wsrm:Identifier>
      <wsrm:MessageNumber>1</wsrm:MessageNumber>
    </wsrm:Sequence>
  </S:Header>
  <S:Body>
    <!-- Some Application Data -->
  </S:Body>
</S:Envelope>
```

Message 2

```
<?xml version="1.0" encoding="UTF-8"?>
<S:Envelope xmlns:S="http://www.w3.org/2003/05/soap-envelope"
xmlns:wsrm="http://docs.oasis-open.org/ws-rx/wsrm/200604~~2~~"
xmlns:wsa="http://www.w3.org/2005~~schemas.xmlsoap.org/ws/2004~~/08/addressing">
  <S:Header>
    <wsa:MessageID>
      http://Business456.com/guid/daa7d0b2-c8e0-476e-a9a4-d164154e38de
    </wsa:MessageID>
    <wsa:To>http://example.com/serviceB/123</wsa:To>
    <wsa:From>
      <wsa:Address>http://Business456.com/serviceA/789</wsa:Address>
    </wsa:From>
    <wsa:Action>http://example.com/serviceB/123/request</wsa:Action>
    <wsrm:Sequence>
      <wsrm:Identifier>http://Business456.com/RM/ABC</wsrm:Identifier>
      <wsrm:MessageNumber>2</wsrm:MessageNumber>
    </wsrm:Sequence>
  </S:Header>
  <S:Body>
    <!-- Some Application Data -->
  </S:Body>
</S:Envelope>
```

Message 3

```
<?xml version="1.0" encoding="UTF-8"?>
<S:Envelope xmlns:S="http://www.w3.org/2003/05/soap-envelope"
xmlns:wsrm="http://docs.oasis-open.org/ws-rx/wsrm/200604~~2~~"
xmlns:wsa="http://www.w3.org/2005~~schemas.xmlsoap.org/ws/2004~~/08/addressing">
 <S:Header>
  <wsa:MessageID>
   http://Business456.com/guid/0baaf88d-483b-4ecf-a6d8-a7c2eb546819
  </wsa:MessageID>
  <wsa:To>http://example.com/serviceB/123</wsa:To>
  <wsa:From>
   <wsa:Address>http://Business456.com/serviceA/789</wsa:Address>
 </wsa:From>
 <wsa:Action>http://example.com/serviceB/123/request</wsa:Action>
 <wsrm:Sequence>
  <wsrm:Identifier>http://Business456.com/RM/ABC</wsrm:Identifier>
  <wsrm:MessageNumber>3</wsrm:MessageNumber>
 </wsrm:Sequence>
 <wsrm:AckRequested>
  <wsrm:Identifier>http://Business456.com/RM/ABC</wsrm:Identifier>
 </wsrm:AckRequested>
</S:Header>
<S:Body>
 <!-- Some Application Data -->
</S:Body>
</S:Envelope>
```

B.3 First Acknowledgement

Message number 2 has not been received by the RM Destination due to some transmission error so it responds with an acknowledgement for messages 1 and 3:

```
<?xml version="1.0" encoding="UTF-8"?>
<S:Envelope xmlns:S="http://www.w3.org/2003/05/soap-envelope"
xmlns:wsrm="http://docs.oasis-open.org/ws-rx/wsrm/200604~~2~~"
xmlns:wsa="http://www.w3.org/2005~~schemas.xmlsoap.org/ws/2004~~/08/addressing">
 <S:Header>
  <wsa:MessageID>
   http://example.com/guid/0baaf88d-483b-4ecf-a6d8-a7c2eb546810
  </wsa:MessageID>
  <wsa:To>http://Business456.com/serviceA/789</wsa:To>
  <wsa:From>
   <wsa:Address>http://example.com/serviceB/123</wsa:Address>
  </wsa:From>
  <wsa:Action>
    http://docs.oasis-open.org/ws-rx/wsrm/200604~~2~~/SequenceAcknowledgement
  </wsa:Action>
  <wsrm:SequenceAcknowledgement>
   <wsrm:Identifier>http://Business456.com/RM/ABC</wsrm:Identifier>
   <wsrm:AcknowledgementRange Upper="1" Lower="1"/>
   <wsrm:AcknowledgementRange Upper="3" Lower="3"/>
  </wsrm:SequenceAcknowledgement>
 </S:Header>
 <S:Body/>
</S:Envelope>
```

B.4 Retransmission

The RM Sourcediscovers that message number 2 was not received so it resends the message and requests an acknowledgement:

```
<?xml version="1.0" encoding="UTF-8"?>
<S:Envelope xmlns:S="http://www.w3.org/2003/05/soap-envelope"
xmlns:wsrm="http://docs.oasis-open.org/ws-rx/wsrm/200604~~2~~"
xmlns:wsa="http://www.w3.org/2005~~schemas.xmlsoap.org/ws/2004~~/08/addressing">
 <S:Header>
  <wsa:MessageID>
   http://Business456.com/guid/daa7d0b2-c8e0-476e-a9a4-d164154e38de
  </wsa:MessageID>
  <wsa:To>http://example.com/serviceB/123</wsa:To>
  <wsa:From>
   <wsa:Address>http://Business456.com/serviceA/789</wsa:Address>
  </wsa:From>
  <wsa:Action>http://example.com/serviceB/123/request</wsa:Action>
  <wsrm:Sequence>
   <wsrm:Identifier>http://Business456.com/RM/ABC</wsrm:Identifier>
   <wsrm:MessageNumber>2</wsrm:MessageNumber>
  </wsrm:Sequence>
  <wsrm:AckRequested>
   <wsrm:Identifier>http://Business456.com/RM/ABC</wsrm:Identifier>
  </wsrm:AckRequested>
 </S:Header>
 <S:Body>
  <!-- Some Application Data -->
 </S:Body>
</S:Envelope>
```

B.5 Termination

The RM Destination now responds with an acknowledgement for the complete S~~s~~equence which can then be terminated:

```
<?xml version="1.0" encoding="UTF-8"?>
<S:Envelope xmlns:S="http://www.w3.org/2003/05/soap-envelope"
xmlns:wsrm="http://docs.oasis-open.org/ws-rx/wsrm/200604~~2~~"
xmlns:wsa="http://www.w3.org/2005~~schemas.xmlsoap.org/ws/2004~~/08/addressing">
 <S:Header>
  <wsa:MessageID>
   http://example.com/guid/0baaf88d-483b-4ecf-a6d8-a7c2eb546811
  </wsa:MessageID>
  <wsa:To>http://Business456.com/serviceA/789</wsa:To>
  <wsa:From>
   <wsa:Address>http://example.com/serviceB/123</wsa:Address>
  </wsa:From>
  <wsa:Action>
    http://docs.oasis-open.org/ws-rx/wsrm/200604~~2~~/SequenceAcknowledgement
  </wsa:Action>
  <wsrm:SequenceAcknowledgement>
   <wsrm:Identifier>http://Business456.com/RM/ABC</wsrm:Identifier>
   <wsrm:AcknowledgementRange Upper="3" Lower="1"/>
  </wsrm:SequenceAcknowledgement>
 </S:Header>
 <S:Body/>
</S:Envelope>
```

Terminate Sequence

```
<?xml version="1.0" encoding="UTF-8"?>
<S:Envelope xmlns:S="http://www.w3.org/2003/05/soap-envelope"
xmlns:wsrm="http://docs.oasis-open.org/ws-rx/wsrm/200604~~2~~"

C. WSDL

The non-normative WSDL 1.1 definition for WS-ReliableMessaging is located at:

http://docs.oasis-open.org/ws-rx/wsrm/200604/wsdl/wsrm-1.1-wsdl-200604~~2/wsdl/wsrm-1.1-wsdl-200602~~.wsdl

The following non-normative copy is provided for reference.

```
<?xml version="1.0" encoding="utf-8"?>
<!-- 
OASIS takes no position regarding the validity or scope of any intellectual 
property or other rights that might be claimed to pertain to the 
implementation or use of the technology described in this document or the 
extent to which any license under such rights might or might not be available; 
neither does it represent that it has made any effort to identify any such 
rights. Information on OASIS's procedures with respect to rights in OASIS 
specifications can be found at the OASIS website. Copies of claims of rights 
made available for publication and any assurances of licenses to be made 
available, or the result of an attempt made to obtain a general license or 
permission for the use of such proprietary rights by implementors or users of 
this specification, can be obtained from the OASIS Executive Director.
OASIS invites any interested party to bring to its attention any copyrights, 
patents or patent applications, or other proprietary rights which may cover 
technology that may be required to implement this specification. Please 
address the information to the OASIS Executive Director.

D. State Tables

This appendix specifies the non-normative state transition tables for RM Source and RM Destination.

Each cell in the tables in this appendix uses the following convention:

Legend
action to take next state

Table 2 RM Source State Transition Table

Events	**States**							
	None	**Connecting**	**Connected**	**Rollover**	**Closing**	**Closed**	**Terminating**	**Terminated**
Create Sequence	*Transmit Create Sequence* Connecting	N/A	N/A	N/A	N/A	N/A	N/A	N/A
Create Sequence Response	N/A	Connected	N/A	N/A	N/A	N/A	N/A	N/A
Create Sequence Refused Fault	N/A	Terminated	N/A	N/A	N/A	N/A	N/A	N/A
New Message	N/A	N/A	*Transmit message* Connected	*Inhibited*	*Inhibited?* Closing	N/A	N/A	N/A
Retransmit of unack message	N/A	N/A	*Transmit message* Connected	*Transmit message* Rollover	*Trasmit message?* Closing	*Transmit message* Closed	N/A	N/A

In Table 2 above, the rows consists of events that occur at the RM Source throughout the lifetime of an RM Sequence and the columns consists of various RM Source states. Each cell in the table above lists the action that the RM Source takes on occurrence of a particular event and the next state that it transitions.

Table 3 RM Destination State Transition Table

In Table 3 above, the rows consists of events that occur at the RM Destination throughout the lifetime of an RM Sequence and the columns consists of various RM Destination states. Each cell in the table above lists the action that the RM Destination takes on occurrence of a particular event and the next state that it transitions.

E. Acknowledgments

This document is based on initial contribution to OASIS WS-RX Technical Committee by the following authors:

Ruslan Bilorusets, BEA, Don Box, Microsoft, Luis Felipe Cabrera, Microsoft, Doug Davis, IBM, Donald Ferguson, IBM, Christopher Ferris, IBM (Editor), Tom Freund, IBM, Mary Ann Hondo, IBM, John Ibbotson, IBM, Lei Jin, BEA, Chris Kaler, Microsoft, David Langworthy, Microsoft (Editor), Amelia Lewis, TIBCO Software, Rodney Limprecht, Microsoft, Steve Lucco, Microsoft, Don Mullen, TIBCO Software, Anthony Nadalin, IBM, Mark Nottingham, BEA, David Orchard, BEA, Jamie Roots, IBM, Shivajee Samdarshi, TIBCO Software, John Shewchuk, Microsoft, Tony Storey, IBM.

The following individuals have provided invaluable input into the initial contribution:

Keith Ballinger, Microsoft, Stefan Batres, Microsoft, Allen Brown, Microsoft, Michael Conner, IBM, George Copeland, Microsoft, Francisco Curbera, IBM, Paul Fremantle, IBM, Steve Graham, IBM, Pat Helland, Microsoft, Rick Hill, Microsoft, Scott Hinkelman, IBM, Tim Holloway, IBM, Efim Hudis, Microsoft, Gopal Kakivaya, Microsoft, Johannes Klein, Microsoft, Frank Leymann, IBM, Martin Nally, IBM, Peter Niblett, IBM, Jeffrey Schlimmer, Microsoft, James Snell, IBM, Keith Stobie, Microsoft, Satish Thatte, Microsoft, Stephen Todd, IBM, Sanjiva Weerawarana, IBM, Roger Wolter, Microsoft.

The following individuals were members of the committee during the development of this specification:

TBD

F. Revision History

Rev	Date	By Whom	What
wd-01	2005-07-07	Christopher Ferris	Initial version created based on submission by the authors.
ws-02	2005-07-21	Doug Davis	I011 (PT0S) added
wd-02	2005-08-16	Anish Karmarkar	Trivial editorial changes
ws-03	2005-09-15	Doug Davis	I019 and i028 (CloseSeq) added
wd-05	2005-09-26	Gilbert Pilz	i005 (Source resend of nacks messages when ack already received) added.
wd-05	2005-09-27	Doug Davis	i027 (InOrder delivery assurance spanning multiple sequences) added
wd-05	2005-09-27	Doug Davis	i020 (Semantics of “At most once” Delivery Assurance) added
wd-05	2005-09-27	Doug Davis	i034 (Fault while processing a piggy-backed RM header) added
wd-05	2005-09-27	Doug Davis	i033 (Processing model of NACKs) added
wd-05	2005-09-27	Doug Davis	i031 (AckRequested schema inconsistency) added
wd-05	2005-09-27	Doug Davis	i025 (SeqAck/None) added
wd-05	2005-09-27	Doug Davis	i029 (Remove dependency on WS-Security) added
wd-05	2005-09-27	Doug Davis	i039 (What does 'have a mU attribute' mean) added
wd-05	2005-09-27	Doug Davis	i040 (Change 'optiona'/'required' to 'OPTIONAL'/'REQUIRED') added
wd-05	2005-09-30	Anish Karmarkar	i017 (Change NS to http://docs.oasis-open.org/wsrm/200510/)
wd-05	2005-09-30	Anish Karmarkar	i045 (Include SecureConversation as a reference and move it to non-normative citation)
wd-05	2005-09-30	Anish Karmarkar	i046 (change the type of wsrm:FaultCode element)
wd-06	2005-11-02	Gilbert Pilz	Start wd-06 by changing title page from cd-01.
wd-06	2005-11-03	Gilbert Pilz	i047 (Reorder spec sections)
wd-07	2005-11-17	Gilbert Pilz	Start wd-07
wd-07	2005-11-28	Doug Davis	i071 – except for period in Appendix headings
wd-07	2005-11-28	Doug Davis	i10
wd-07	2005-11-28	Doug Davis	i030
wd-07	2005-11-28	Doug Davis	i037
wd-07	2005-11-28	Doug Davis	i038
wd-07	2005-11-28	Doug Davis	i041
wd-07	2005-11-28	Doug Davis	i043
wd-07	2005-11-28	Doug Davis	i044

Rev	Date	By Whom	What
wd-07	2005-11-28	Doug Davis	i048
wd-07	2005-11-28	Doug Davis	i051
wd-07	2005-11-28	Doug Davis	i053
wd-07	2005-11-28	Doug Davis	i059
wd-07	2005-11-28	Doug Davis	i062
wd-07	2005-11-28	Doug Davis	i063
wd-07	2005-11-28	Doug Davis	i065
wd-07	2005-11-28	Doug Davis	i067
wd-07	2005-11-28	Doug Davis	i068
wd-07	2005-11-28	Doug Davis	i069
wd-07	2005-11-28	Doug Davis	Fix bulleted list (#2) in section 2.3
wd-07	2005-11-29	Gilbert Pilz	i074 (Use of [tcShortName] in artifact locations namespaces, etc)
wd-07	2005-11-29	Gilbert Pilz	i071 – Fixed styles and formating for TOC. Fixed styles of the appendix headings.
wd-07	2005-11-30	Doug Davis	Removed dup definition of "Receive"
wd-07	2005-11-30	Gilbert Pilz	Fixed lost formatting from heading for Namespace section. Fixed style of text body elements to match OASIS example documents. Fixed tables to match OASIS example documents.
wd-07	2005-12-01	Gilbert Pilz	Updated fix for i074 to eliminate trailing '/'. Added corresponding text around action IRI composition.
wd-07	2005-12-01	Gilbert Pilz	Use non-fixed fields for date values on both title page and body footers.
wd-07	2005-12-01	Doug Davis	Alphabetize the glossary
wd-07	2005-12-02	Doug Davis	i064
wd-07	2005-12-02	Doug Davis	i066
wd-08	2005-12-15	Doug Davis	Add back in RM Source to glossary
wd-08	2005-12-15	Steve Winkler	Doug added Steve's editorial nits
wd-08	2005-12-21	Doug Davis	i050
wd-08	2005-12-21	Doug Davis	i081
wd-08	2005-12-21	Doug Davis	i080 – but i050 negates the need for any changes
wd-08	2005-12-21	Doug Davis	i079
wd-08	2005-12-21	Doug Davis	I076 – didn't add text about "replies" since the RMD to RMS sequence could be used for any message not just replies
wd-08	2005-12-21	Umit Yalcinalp	Action Su03: removed wsse from Table 1
wd-08	2005-12-21	Umit Yalcinalp	I057 per Sunnyvale F2F 2005, Cleaned up some formatting errors in contributors
wd-08	2005-12-27	Doug Davis	i060
wd-08	2005-12-27	Gilbert Pilz	Moved schema and WSDL files to their own artifacts. Converted source document to

Rev	Date	By Whom	What
			OpenDocument Text format. Changed line numbers to be a single style.
wd-08	2005-12-28	Anish Karmarkar	Included a section link to c:\temp\wsrm-1.1-schema-200510.xsd and to c:\temp\wsrm-1.1-wsdl-200510.wsdl
wd-08	2006-01-04	Gilbert Pilz	Fixed formatting for included sections.
wd-08	2006-01-05	Gilbert Pilz	Created links for unused references. Fixed exemplars for CloseSequence and CloseSequenceResponse.
wd-09	2006-01-11	Doug Davis	Minor tweaks to text/typos.
wd-10	2006-01-23	Doug Davis	Accept all changes from wd-09 Make some minor editoral tweaks from Marc's comments.
wd-10	2006-02-14	Doug Davis	Issue 082 resolution
wd-10	2006-02-14	Doug Davis	Issue 083 resolution
wd-10	2006-02-14	Doug Davis	Issue 085 resolution
wd-10	2006-02-14	Doug Davis	Issues 086, 087 resolutions Defined MessageNumberType
wd-10	2006-02-15	Doug Davis	Issue 078 resolution
wd-10	2006-02-15	Doug Davis	Issue 094 resolution
wd-10	2006-02-15	Doug Davis	Issue 095 resolution
wd-10	2006-02-15	Gilbert Pilz	Issue 088 – added namespace URI link to namespace URI; added text explaining that this URI could be dereferenced to produce the RDDL doc; added non-normative reference to RDDL 2.0
wd-10	2006-02-17	Anish Karmarkar	Namespace changed to 200602 for both WSDL and XSD docs.
wd-10	2006-02-17	Anish Karmarkar	Issue i087 as it applies to WSRM spec.
wd-10	2006-02-17	Anish Karmarkar	Added titles and minor text for state table (issue i058).
wd-11	2006-02-22	Doug Davis	Accept all changes for new WD Minor typos fixed
wd-11	2006-02-23	Doug Davis	s/'close'/close/g – per Marc Goodner Added first ref to [URI] – per Marc G again
wd-11	2006-02-27	Doug Davis	Issue i061 applied
wd-11	2006-02-28	Doug Davis	Fixed typo around the use of "above" and "below"
wd-11	2006-03-01	Doug Davis	Minor typos found by Marc Goodner
wd-11	2006-03-02	Doug Davis	Minor typos found by Matt Lovett
wd-11	2006-03-08	Doug Davis	Issue 091 applied
wd-11	2006-03-08	Doug Davis	Issue 092 applied
wd-11	2006-03-08	Doug Davis	Issue 100 applied

Rev	Date	By Whom	What
wd-12	2006-03-20	Doug Davis	Added space in "SOAP1.x" – PaulCotton
wd-12	2006-04-11	Doug Davis	Issue 007 applied
wd-12	2006-04-11	Doug Davis	Issue 090 applied
wd-12	2006-04-11	Doug Davis	Issue 098 applied
wd-12	2006-04-11	Doug Davis	Issue 099 applied
wd-12	2006-04-11	Doug Davis	Issue 101 applied
wd-12	2006-04-11	Doug Davis	Issue 103 applied
wd-12	2006-04-11	Doug Davis	Issue 104 applied
wd-12	2006-04-11	Doug Davis	Issue 105 applied
wd-12	2006-04-11	Doug Davis	Issue 107 applied
wd-12	2006-04-11	Doug Davis	Issue 109 applied
wd-12	2006-04-11	Doug Davis	Issue 110 applied
wd-12	2006-04-12	Doug Davis	Used "generated" instead of "issue" or "send" when talking about faults.
wd-12	2006-04-24	Gilbert Pilz	Update references to WS-Addressing to the Proposed Recommendations; update WS-RM namespace to “200604”.
