85 DOCUMENT HISTORY 49
86

87 **Purpose**

88 This document catalogs issues for the eXtensible Access Control Markup Language (XACML)
89 developed the Oasis eXtensible Access Control Markup Language Technical Committee.

90 **Introduction**

91 The issues list presented here documents issues brought up in response to draft documents as
92 well as other issues mentioned on the xacml mailing list, in conference calls, and in other venues.
93 The structure of this document was taken from the Security Assertion Markup Language
94 (SAML) Issues List document maintained at the Security Services Technical Committee
95 document repository. Each issue is formatted as follows:

96 ISSUE:[Document/Section Abbreviation-Issue Number: Short name] Issue long description.
97 Possible resolutions, with optional editor resolution Decision

98 The issues are informally grouped according to general areas of concern. For this document, the
99 "Issue Number" is given as "#-##", where the first number is the number of the issue group.

100 To make reading this document easier, the following convention has been adopted for shading
101 sections in various colors.

102 Gray is used to indicate issues that were previously closed.

103 Blue is used to indicate issues that have been flagged as ready to close in the most recent
104 revision. These require review and voting by the committee and they can be closed.

105 Yellow is used to indicated issues which have recently been created or modified or are actively
106 being debated.

107 Other open issues are not marked, i.e. left white.

108 Issues with lengthy write-ups, that have been closed “for some time” will be removed from this
109 document, in order to reduce its overall size. The headings, a short description and resolution
110 will be retained. All vote summaries from closed issues will also be removed.

111 **Use Case Issues**

112 **Group 1: Group Name**

113 **Design Issues**

114 **Group 1: Group Name**

115 **Policy Model Issues**

116 **Group 1: Rules**

117 **ISSUE:**[\[PM-1-01: Negative Authorizations\]](#)

118 Authorizations can be either positive (permit) or negative (deny). Should we allow both?

119 *See also PM-1-01-A which was split off from this issue.*

120 Potential Resolutions:

121 [Michiharu] There seems to be agreement on the fact that the core schema should support
122 positive authorizations only. Negative ones are supported as an extension.

123 [Tim] XACML shall address the requirement for "negative rules" by means of an "and-not-or"
124 construct. [PM-1-01]

125 [Tim] We use a construct of the following form ...

```
126 <and>  
127   <rule1/><rule2/><rule3/>  
128   <not>  
129     <or>  
130       <rule4/><rule5/>  
131 </or></not></and>
```

132 Rule4 and rule5 specify circumstances under which, if either were to hold, access is to be denied.
133 While rule1, rule 2 and rule3 specify circumstances, all of which must hold if access is to be
134 granted.

135 Champion: Michiharu

136 Status: Open

137 **ISSUE:[PM-1-01-A: Implementing global deny and Meta-Policies]**

138 Implementing global "deny" semantics using schema 0.8 and meta-policies

139 [Anne] USE CASE: policy is to deny access to Principal "Anne Anderson" under all conditions.
140 The policy is distributed across many sub-policies, which are all combined to produce the global
141 policy that is to be applied.

142 Michiharu's concern was with needing to put something like

```
143 <not><equal>  
144   <valueRef entity="principal">saml:Subject/NameIdentifier/Name</valueRef>  
145   <value>"Anne Anderson"</value>  
146 </equal></not>
```

147 Into every sub-policy if there was no global "deny" syntax.

148 My proposed solution depends on the idea of having meta-policies. I think meta-policies solve
149 multiple problems:

- 150 1. "Where do I get policies",
- 151 2. Knowing when you have obtained all the relevant policies,
- 152 3. Knowing how to combine policies
- 153 4. being able to implement global "deny" and meta-policies does not introduce any new syntax.
154 It is just very explicit in specifying what "applicable policy" means.

155 Potential Resolutions:

156 [Anne] Each PDP (or PRP) needs to be configured with a single policy that serves as that PDP's
157 "meta-policy". The syntax of this single policy is exactly that in 0.8.

158 This "meta-policy" determines where and under what conditions various sub-policies are
159 retrieved. I may not be using <externalFunction> correctly, or the subpolicies may need more
160 enclosing namespace information, but I hope these examples will give the idea. The final
161 example shows how global "deny" semantics are implemented.

162 EXAMPLE SIMPLE META-POLICY FOR DISTRIBUTED POLICIES:

```
163 <?xml version="1.0" encoding="UTF-8"?>  
164 <applicablePolicy xmlns=... issuer="<identity that ultimately controls policy for this PDP>"  
165 policyName="...">  
166   <!-- target omitted, since this policy applies to all targets -->  
167   <policy>  
168     <and>
```

```

169     <externalFunction>http://www.site1/policy1.xml</externalFunction>
170     <externalFunction>http://www.site2/policy2.xml</externalFunction>
171     ...
172     </and>
173     </policy>
174 </applicablePolicy>

```

175 What is found at each of the <externalFunction> locations is another <applicablePolicy>, which
 176 may be more specific as to which resources it applies to (that applicablePolicy in turn may refer
 177 to still other policies). If one of these <applicablePolicy> elements does not apply to the current
 178 request, then the result is "does not apply" and does not affect the result of the <and> evaluation.

179 META-POLICY THAT USES SUB-POLICIES BASED ON RESOURCE

```

180 <?xml version="1.0" encoding="UTF-8"?>
181 <applicablePolicy xmlns=... issuer="<identity that ultimately controls policy for this PDP>"
182   policyName="...">
183   <!-- target omitted, since this policy applies to all targets -->
184   <policy>
185     <or>
186       <and>
187         <equal>
188           <valueRef>saml:Resource</valueRef>
189           <value>"file:/host1/*"</value>
190         </equal>
191         <externalFunction>http://www.site1/policy1.xml</externalFunction>
192       </and>
193       <and>
194         <equal>
195           <valueRef>saml:Resource</valueRef>
196           <value>"file:/host2/*"</value>
197         </equal>
198         <externalFunction>http://www.site2/policy2.xml</externalFunction>
199       </and>
200     ...
201   </or>
202 </policy>
203 </applicablePolicy>

```

204 META-POLICY THAT IMPLEMENTS GLOBAL DENY SEMANTICS

```

205 <?xml version="1.0" encoding="UTF-8"?>
206 <applicablePolicy xmlns=... issuer="<identity that ultimately controls policy for this PDP>"
207   policyName="...">

```

```

208 <!-- target omitted, since this policy applies to all targets -->
209 <policy>
210   <and>
211     <not>
212       <equal>
213         <valueRef entity="principal">saml:Subject/NameIdentifier/Name</valueRef>
214         <value>"Anne Anderson"</value>
215       </equal>
216     </not>
217   <or>
218     <and>
219       <equal>
220         <valueRef>saml:Resource</valueRef>
221         <value>"file:/host1/*"</value>
222       </equal>
223       <externalFunction>http://www.site1/policy1.xml</externalFunction>
224     </and>
225     <and>
226       <equal>
227         <valueRef>saml:Resource</valueRef>
228         <value>"file:/host2/*"</value>
229       </equal>
230       <externalFunction>http://www.site2/policy2.xml</externalFunction>
231     </and>
232     ...
233   </or>
234 </and>
235 </policy>
236 </applicablePolicy>

```

237 For administrative ease in a more realistic situation, the set of globally denied attribute/value
 238 combinations would be placed in one <externalFunction> policy.

239 [Ernesto] I support this proposal. I believe it could deal smoothly with the distributed scenario
 240 Anne described many times during the last conference call. It goes in the same direction of a
 241 previous suggestion of mine (deal with composition and distributed deployment at the
 242 ApplicablePolicy level), but does it far better. However, I would suggest some minor
 243 observations/amendments (otherwise there is no fun :-))

244 1. Maybe this is trivial, but any change to the current schema should keep policies fully
 245 embeddable in the Applicable policy element, besides being able to point to them using external
 246 functions. In simple environments there will be only one local policy, stated in a single
 247 document.

248 2. I happen not to like very much using the word "meta-policy" to describe this proposal, for
249 several reasons some of which would be too long to explain in this message. Basically, I regard
250 Anne's technique mainly as a way to define how a global policy can be deployed in distributed,
251 independently maintained retrieval units. In passing, it also solves the problem of stating which
252 criterion should be applied to compose the outcome of such units (this is essential when "deny"
253 is a possible outcome, as the criterion may have an impact on what actually needs to be
254 retrieved), but I cannot convince myself this requirement is equally important. I believe (but
255 would like to hear the opinion of the industrial researchers on this one) that there will be a
256 default policy composition technique that will be used 99.9% of the times. Therefore, in the
257 schema I would prefer to concentrate the deployment description functionality in a new element,
258 perhaps called "ApplicablePolicies" , possibly defined as an extension of the base
259 (Applicable)Policy type. This element could optionally (via an attribute) specify the composition
260 criterion as well. Tim, what are your views?

261 [Hal] I am not sure if I agree with Anne's approach. I certainly like it better than the alternative
262 proposed. I actually thought we had previously agreed that there had to be some rules (policy)
263 for determining how independently created policies should be combined to achieve an
264 authorization decision.

265 Instead of meta-policy, which I think Ernesto fears will be take to mean "more abstract policy" or
266 "policy about policy", perhaps something like Policy Federation Rules would be better.

267 It seems to me the key issues are:

268 1. Where and how are PFR specified? Anne's approach is a distinct XML document, which must
269 be consistent throughout the policy federation. This seems reasonable to me.

270 2. What are the possible PFR's? I think "AND" is impractical, and "OR" is most likely, however
271 some kind of best-match-to-target is conceivable although perhaps too expensive to implement in
272 practice.

273 3. Do all legal PFR's have to support all decision strategies? I have been thinking about this and I
274 think the right approach is to explicitly call out the possible decision strategies and for each legal
275 PFR state which can or cannot be used.

276 Here's what I have so far on decision strategies.

277 Strategy I - Basic

- 278 1. Collect all applicable policies
- 279 2. Obtain all required inputs
- 280 3. Evaluate all policies
- 281 4. Apply PFR to resolve conflicting results

282 Strategy II - Optimized

- 283 1. Collect all applicable policies
- 284 2. Use PFR to create equivalent combined policy
- 285 3. Evaluate policies incrementally, gathering inputs as needed, defer evaluations based on
286 inputs requirements (this for example allows "lazy authentication" where authentication
287 is not done if the result can be determined without it)
- 288 4. Once the result is known, stop evaluation

289 Strategy III- Incremental collection

- 290 1. Collect "some" policies
- 291 2. Obtain required inputs
- 292 3. Evaluate current policy set
- 293 4. Use PFR to combine latest results with previous results (if any)
- 294 5. If result is known, stop evaluation
- 295 6. If not all policies have been collected, repeat previous steps

296 These are all the possibilities I can think of. Can anyone think of others? I think anything
297 proposed to date works equally for I and II, but not all work for III. However, we may find future
298 possibilities that only work for one of them.

299 To answer Ernesto's question, our product uses "OR" for authorization decisions and "AND" for
300 audit decisions and there have been no complaints. However we do not have post conditions,
301 which may change things.

302 As far as the global deny, I would like to understand the requirements better. It seems the
303 problem Anne is trying to solve is "master policy admin can globally deny regardless of what the
304 policy combining rules are."

305 Is this the right problem to solve? If an "OR" combining rule is used (which I happen to think is
306 the most common case) then any admin can implement a global deny without any special
307 machinery. I think the example given is a red herring to some extent, because the right way to cut
308 off an individual user is to change their attributes at the Attribute Authority or revoke their
309 credentials.

310 The problem I see is that most evaluation engines will want to use a relatively fixed decision
311 strategy in order to optimize it according to the criteria that apply in that environment. Finding it
312 out in the middle of policy evaluation will interfere with this goal.

313 [Michiharu] I also support Anne's proposal. I think this technique deal with the distributed
314 scenario nicely. I said the similar idea that uses an external function to call sub applicable
315 policies in the policy model con-call on Dec. 17 but Anne's description is much more concrete
316 and easy to understand. For the global deny policy, I agree that this technique is useful to specify
317 the global deny semantics. If this technique is agreed, we may need more intuitive name for the
318 externalFunction.

319 [Pierangela] I agree with the fact that the current proposal is able to implement the global deny
320 scenario. No doubt about that: if you restrictions (i.e., the deny you want to enforce) ANDED
321 with the other possible policies nobody will be able to overrule your restrictions.

322 The reason why I am not too excited with the current proposal is that it seems perfectly fine for
323 communicating policies, but it seems complex to manage.

324 First of all you have to make sure that the applicable policy is in a single place (sure possibly
325 using URL of other policies) but you cannot allow overlapping targets (which seemed to be the
326 case till now, I believe).

327 Second the priority of your rules is explicitly managed with the policy definition, which may
328 make administration heavy. Who is in charge of specifying the applicable policy? This will be
329 the only one able to specify global deny: if understand Tim/Anne's proposals correctly possible
330 negative authorizations in other policies have the effect only within that policy (this is fine with
331 me, it seems conceptually clean).

332 Now for instance, suppose you want to enforce a situation in which any of us can grant
333 authorizations and, possibly denials, for some access and a denial-take-precedence policy should
334 be enforced (meaning it sufficient that one of us says "deny (because of a negative
335 authorization), and the access should be rejected. How do you enforce this? You cannot have the
336 different administrators operate on the applicable policy (meaning actually have writing privilege
337 on that document).

338 [From 2/18 minutes] A metapolicy can state how you should combine classes of rules or of
339 policies. For instance, it could query attributes of rules (e.g., sign) or of policies (corporate
340 policies as opposed to department policies). Simon notes there are two components. one is how
341 to solve conflicts, you do not really need this syntax. The other level is when you start combining
342 policies, here you need the expressive power of the metapolicy language. So for meta-policies
343 associated with elementary policies we could have a pre-defined URI expressing the conflict
344 resolution policy without need to use the metapolicy specification language. It is however noted
345 that at the URI you should find a metapolicy expressed.

346

347 NOTE: We once said it would be nice if we had at least an example of meta-policy in our
348 proposal. Should we have it explicitly mentions ``meta-policy one"?

349 Champion: Anne

350 Status: Open

351 **ISSUE:[PM-1-02: Post-Conditions]**

352 The current schema [Tim, Jan.3] mentions post-conditions, distinguishing between external and
353 internal, depending on whether their execution requires dialoging with external entities. The
354 current schema suggests (via a comment) that post-conditions can be expressed as invocations of
355 SOAP services. Post-conditions are still to be discussed in details: what is their semantics; how
356 are they executed? A complication of post-conditions associated with a rule involves the
357 distributed scenario (see POLICY COMPOSITION issue). In fact, if I say that a post-condition
358 should be applied whenever a rule fires then I have to evaluate *all* rules. A possible way to
359 overcome this problem is to consider that post-conditions associated with the authorizations that
360 were evaluated to get to an access decision should be executed [Tim]. Note: a possible drawback
361 of this approach is that deterministic behavior may be lost. For instance, there may be N rules
362 applying to an access. If the evaluation of 1 of them brings to a ``permit" decision (so there is no
363 need to evaluate the others). Then, you would ignore the post conditions possibly associated with
364 the other N-1. Different execution of the same request on the same state could then have a
365 different behavior (because a different rule is considered as authorizing the request.

366 [Tim] The alternative view is that post-conditions must be executed if and only if the associated
367 rule contributes to the permit decision.

368 [Polar] What is the purpose for actions (i.e. these post conditions) after checking a policy? What
369 types of actions are allowed? Do they change the state of the policy?

370 [Pierangela] examples that were brought up for post-conditions were things like "logging the
371 request", essentially they are actions that the system executes in response to granting an access,
372 or simply having evaluated the authorizations (discussion on the specific behavior is still open).

373 Do they change the state of the policy? If you mean the set of rules I guess the answer is no (they
374 should not change the rules). But again, post-conditions are one of the issues which have not
375 discussed fully.

376 [Polar] Well, I had originally thought that a "post-condition" would be something that would be
377 true if the policy evaluated to true according to its input. That is, a "post-condition" should be a
378 logical consequence, but maybe not fully derivable by all available information. This post-
379 condition would merely be some advice to the evaluator.

380 Such as Policy stating that:

381 Subject is in Role of MissileLauncher to the Resource of Missile on Action Launch.

382 Post-condition Subject is dangerous.

383 I really don't like the fact that these post conditions mandate that some generic operation be
384 performed, i.e. it could be used to alter state, especially the state of the policy.

385 [Simon] Post-condition is executed after the rule fires and does not affect grant/deny

386 Outcome of the rule. With this definition we can not predict which post condition(s) will be
387 executed for a given authorization request. This is not desirable. One way to make post-
388 conditions predictable is to associate post condition not with a rule but with the outcome of grant
389 or deny, e.g.:

390 on_grant do_something

391 on_deny do_something

392 That means every time any subject is granted (or denied) action on any resource all post-
393 conditions listed in on_grant (or on_deny) will be predictably executed. On_grant and on_deny
394 post-conditions could be associated with specific action, subject, and resource triplet, meaning
395 that given post-condition will be executed every time subject is granted or denied permission to
396 access resource.

397 on_grant(action, subject, resource) do_something;

398 on_deny(action, subject, resource) do_something;

399 [John]

400 > Post-condition is executed after the rule fires and does not affect

401 > grant/deny outcome of the rule.

402 I thought this was only true of *external* post-conditions? I thought that an internal post-
403 condition must be executed (by the PDP) BEFORE the response is asserted, and therefore does
404 affect the outcome...

405 The spec says:

406 "...Post-condition - A process specified in a rule that must be completed in conjunction with
407 access. There are two types of post-condition: an internal post-condition must be executed by the
408 PDP prior to the issuance of a "permit" response, and an external post-condition must be
409 executed by the PEP prior to permitting access..."

410 I'm assuming that the "musts" here imply that the required actions are successfully executed. Is
411 this not the case?

412 [Simon] The way I remember post-conditions discussions is that outcome of internal post
413 condition does not affect the outcome of azn decision, i.e., first grant (or deny) is computed and
414 then internal post-condition is executed. If, for example, pdp fails to add a record to the log it
415 still returns computed outcome (grant or deny) to the pep. So the internal post-condition may not
416 be successfully executed by the pdp.

417 [Tim] This can be accomplished with the current syntax.

418 applicablePolicy/policy/rule+post-condition

419 This post-condition is executed if access is permitted.

420 applicablePolicy/policy/not/Rule+post-condition

421 This post-condition is executed if access is denied.

422 [Bill]

423 If given this:

424 > With this definition we can not predict which post condition(s) will be

425 > executed for a given

426 > Authorization request. This is not desirable.

427 'do_something' cannot be guaranteed:

428 > on_grant(action, subject, resource) do_something;

429 > on_deny(action, subject, resource) do_something;

430 Because that would require acknowledgement that it occurred (implying dependence on
431 grant/deny). Sounds like 'post condition' in this sense is more like 'post request'.

432 [Hal] I clearly remember that the sense of the group was that the PDP MUST insure that an
433 internal post condition occurs, but not necessarily before the permit decision is returned. Post
434 conditions were never considered optional. They are just as required for "permit" as pre-
435 conditions are. That was the rationale for the name.

436 Potential Resolutions:

437 [Tim] XACML shall require the PDP/PEP to execute just those post-conditions that accompany
438 the rules that contribute to the "permit" decision. [PM-1-02]

439 See email to list from Michiharu on 2/11/2002 with a proposal for post conditions

440 Champion: Simon

441 Status: Open

442 [ISSUE:\[PM-1-03: Post-Conditions as a term\]](#)

443 [Bill] I know that it is late to bring this up, but I find the term 'post condition' unintuitive.

444 Typically, this phrase means the *state* of something after an action, not something to be acted
445 upon. It seems that the way we are using the term implies quite a bit about the context of what is
446 being done. (post what? where?) I think this is being demonstrated by the discussions
447 surrounding the scope of said phrase. In my mind, it would seem that something like 'adjunct
448 policy' or 'adjunct policy condition' would be more appropriate?

449 [Pierangela] I share this feeling (incidentally, I brought it up in the last conference call, and also
450 in previous once). I was interpreting them more as "actions" than "conditions".

451 [Pierangela] in today's TC conference call, some people mentioned that "action" is already used
452 with different semantics (=the operation the principal is requesting). That's true, so we should
453 find another term. The point is, however, that the semantics of "post conditions" now seems
454 really to be a reaction of the system, not the evaluation of a state, so terminology should reflect
455 the semantics.

456 Potential Resolutions:

- 457 1. adjunct policy
- 458 2. adjunct policy condition
- 459 3. actions

460 Bill: for me, one of the problems with the term 'post-condition' is that it technically refers to the
461 state* of something after an event, not something that must be done (as is the case with the term
462 'pre-condition'). this can become confusing when working in other contexts (like UML:
463 Postconditions - Describe the state of the system, and perhaps the actors, after the use case is
464 complete...")

465 for starters, how about these?

466 Stipulation, provision, proviso, constraint, obligation, caveat, directive, regulation

467 i am sure we can come with a number of alternative terms that will work. personally, i like
468 'obligation', because in this model this is really what you have: the PEP has an obligation to
469 enforce the rulings of the PDP (i.e. GRANT) under the terms defined by the PDP (e.g. 'delete
470 after 30 days') -- if it cannot it must DENY.

471 Champion: Bill

472 Status: Open

473 [ISSUE:\[PM-1-04:References to attributes in XACML predicates\]](#)

474 What information needs to be provided in order to refer to an attribute in an XACML policy
475 predicate?

476 Potential Resolutions:

477 Proposed Resolution:

478 References to attributes associated with the access request in XACML predicates consist of a
479 URI to a document instance that contains the value of the attribute to be evaluated, a URI for the
480 schema for the document, a schema-dependent path for locating a particular attribute instance in
481 the document according to the schema, and an optional name for the Attribute Authority trusted
482 to assign values for this attribute. The AA is located using the PKI with which the PDP is
483 configured.

484 Vote:

485 2/21: There was considerable discussion about whether this was ready to close. The feeling was
486 that we needed to see a specific proposal either free standing or in the working spec before we
487 could vote to close. The issue was raised as to whether we should use XPath expressions here. It
488 was not closed

489 Champion: Anne

490 Status: Open

491 [ISSUE:\[PM-1-05: how NOT-APPLICABLE impacts a combinator expression\]](#)

492 A "combinator expression" is a combination of predicates, where possible combinators are
493 <AND>, <OR>, <NOT>, <N-OF>, <ORDERED-[AND|OR|N-OF]>. This list of Combinators
494 can be extended.

495 Example:

496 <AND>

497 predicate1,

498 predicate2,

499 predicate3

500 </AND>

501 The issue occurs when one or more of the predicates in the list returns a result of NOT-
502 APPLICABLE (this can occur if the predicate is a <referencedPolicy>). What should the result
503 of the combinator expression be? What if ALL predicates in the combinator expression return
504 NOT-APPLICABLE?

505 Potential Resolution:

506 [Anne]

507 a) Any predicate evaluating to NOT-APPLICABLE is logically removed from the combinator
508 expression.

509 Example: if predicate3 in the example above returned a result of NOT-APPLICABLE, then the
510 combinator expression is the result of

511 <AND>

512 predicate1,

513 predicate2

514 <AND>

515 b) An empty combinator expression has the following results:

516 <AND></AND> -> TRUE

517 <OR></OR> -> FALSE

518 <NOT></NOT> -> TRUE

519 <N-OF></N-OF> -> FALSE

520 <ORDERED-[whatever]> has same result as [whatever] above. Extended combinators must
521 define the result of an empty expression.

522 Example: If predicates 1, 2, and 3 in the example above all evaluate to NOT-APPLICABLE,
523 then the combinator expression is <AND></AND>, and the result is TRUE.

524 b)-alternative: An empty combinator expression has a result of NOT-APPLICABLE.

525 [Polar] It's sort of like Anne's alternative #2 below with a couple of differences.

526 First, NOT-APPLICABLE (or Inapplicable?) and Error, are values that do not have an XML
527 representation and are merely a artifact of evaluating policy expressions.

528 I propose the following consistent semantic model.

529 T = true, F = false, N = NOT-APPLICABLE, E = Error

530 The basic crux is that getting a NOT-APPLICABLE in the equation is as if its the NOT-
531 APPLICABLE value isn't even there. For instance,

532 (and x N y) = (and x y)

533 (or x N y) = (or x y)

534 I think that is the semantics we want. That is to say, if the policy doesn't apply, it doesn't enter
535 into the equation. I also surmise to keep things easily consistent in inductive arguments about
536 ANDs and ORs of sequences. The AND or OR of a zero length sequence of values can be
537 anything constant we want, but the minimum element NOT-APPLICABLE would make the
538 most sense, since $(\text{and } x \text{ N}) = (\text{and } x)$, from our assumption above, and, $(\text{and } x) = x$, which is
539 still another wily assumption, but makes sense,

540 So therefore $(\text{and } N) = N$, but from above, $(\text{and } N) = (\text{and})$, Therefore, $(\text{and}) = N$

541 So we would have,

542 $\langle \text{and} \rangle = \text{NOT-APPLICABLE}$

543 $\langle \text{or} \rangle = \text{NOT-APPLICABLE}$

544 Also, to satisfy Hals "the customer's want it", I am almost on the side of allowing NOT in the
545 language with the following semantics:

546 p NOT p

547 -----

548 T F

549 F T

550 N N

551 E E

552 That is to say NOT of NOT-APPLICABLE is still NOT-APPLICABLE. Then NOT distributes
553 through the AND and ORs (i.e. DeMorgan's Law) quite nicely.

554 $(\text{NOT } (\text{AND } N \ x)) = (\text{OR } (\text{NOT } N) (\text{NOT } x))$

555 $(\text{NOT } x) = (\text{OR } N (\text{NOT } x))$

556 $(\text{NOT } x) = (\text{NOT } x)$

557 $(\text{NOT } (\text{OR } N \ x)) = (\text{AND } (\text{NOT } N) (\text{NOT } x))$

558 $(\text{NOT } x) = (\text{AND } N (\text{NOT } x))$

559 $(\text{NOT } x) = (\text{NOT } x)$

560 However, differing from alternative #2 in the proposal below, I believe $\langle \text{NOT} \rangle$
561 shouldn't exist, and it should have one and only one constituent. And empty NOT is a syntax
562 error, as well as having more than one, i.e. $\langle \text{NOT} \rangle \ x \ y \ \langle \text{NOT} \rangle$ shouldn't type check either.
563 (how do you say that in XML? minoccurs=1, maxoccurs=1?).

564 For completeness the truth tables in the 4-valued logic are below for "and", "or" and "not", (ed
565 note: truth tables left out. See original email)

566 Champion: Anne

567 Status: Open

568 [ISSUE:\[PM-1-06: result of <N-OF n=0> combinator expression\]](#)

569 We all agreed that <N-OF n=[something greater than 0]> was an error if there were not at least n
570 predicates to be evaluated. We also agreed that the semantics of <N-OF> were "at least n of".
571 We did not agree on what should be the result of <N-OF n=0>.

572 Potential Resolution:

573 <N-OF n=0> results in TRUE, regardless of the results of the predicates in the combinator
574 expression.

575 Champion: Anne

576 Status: Open

577 [ISSUE:\[PM-1-07: How can the set of combinators be extended?\]](#)

578 We agreed at the March, 2002 F2F that XACML would define the <AND>, <OR>, <NOT>, <N-
579 OF>, and <ORDERED-[AND|OR|NOT|N-OF]> combinators. How can a policy writer extend
580 this set to define a new combinator, such as BEST-MATCH-OR?

581 Potential Resolution:

582 The set of Combinators may be extended by specifying a name for the new Combinator, a URI
583 that is associated with the semantics of the new Combinator, and a type that specifies the way the
584 URI is to be interpreted. Not all XACML PDPs will be able to interpret all extensions, but any
585 PDP that can handle the specified type and can access the specified URI can handle the specified
586 extended Combinator.

587 An example of a possible extended Combinator is BEST-MATCH-OR. The type for such an
588 extended Combinator might be "JavaClass". The URI for each might point to a Java class that
589 takes a set of Predicates as input and implements the semantics of the combinator to return a
590 result of TRUE, FALSE, NOT-APPLICABLE, or ERROR.]

592 Status: Open

593 [ISSUE:\[PM-1-08: syntax for <applicablePolicyReference>\]](#)

594 If a predicate in XACML references an <xacml:applicablePolicy>, what should the syntax for
595 this reference be?

596 Potential Resolution:

597 The syntax should include a URI for <xacml:applicablePolicy> and a URI for the Policy
598 Authority trusted to issue and sign this <xacml:applicablePolicy>. The name attribute in the

599 referenced <xacml:applicablePolicy> must match the URI in the <applicablePolicyReference>.
600 A chain of <applicablePolicyReference> that contains a cycle has a result of ERROR.

601 Champion: Anne

602 Status: Open

603

604 **Group 2: Applicable Policy**

605 [ISSUE:\[PM-2-01: Referencing Multiple Policies\]](#)

606 According to the current schema an Applicable Policy seems to refer to a single Policy. The
607 discussions in the last conference call seem to assume that an Applicable Policy can refer to
608 several Policies (distributed scenario and multiple issuers [Anne]). Is there agreement on this
609 point? If so, the schema should be modified accordingly.

610 Group 1 issues are captured within this

611 [Tim] The current schema allows one possible way of achieving this. Separate applicable
612 policies from independent PAPs (Policy Administration Points) may be combined in a single
613 "applicable policy" by a PRP. This approach does, however, make the original PAPs anonymous.

614 Potential Resolutions:

615 [Tim] An XACML "applicable policy" will not reference external "applicable policies".
616 However, it may "incorporate" external "applicable policies". [PM-2-01] [PM-3-01] [PM-5-03]

617 [Tim] An XACML "applicable policy" shall be capable of referencing an external "applicable
618 policy", providing explicit rules for combining such policies. [PM-2-01] [PM-3-01] [PM-5-03]

619 Champion: Anne

620 Status: Open

621 [ISSUE:\[PM-2-02: Target Specification\]](#)

622 According to the current schema each applicable policy can have multiple targets, each of which
623 is an action and a URI identifying a set of resources (possibly with a transfer function to support
624 wildcards). One may want to specify the target with reference to resource attributes (e.g., this
625 policy applies to all files older that two years). How can I specify this?

626 [Tim] A different transform algorithm is all that is required. In the example, the "classification"
627 is "older than two years", and the transform algorithm specifies how to deduce the age of a file.

628 Simon will present counter deductions to Anne 's proposal at the F2F

629 Potential Resolutions:

630 Ernesto suggests that this issue only mention retrieval of distributed policies and should be
631 updated to reflect the recent discussion and Anne's proposal (See PM-1-01A) about policy
632 combination. Anne volunteers to extend its wording in order to include policy combination as
633 well.

634 Anne: [This note has to do with the syntax for expressing "applicability" of a single policy, and
635 not with the logical rules for combining an inapplicable policy with other policies!!]

636 We currently allow a <target> element predicate in <applicablePolicy> element. The purpose of
637 this element is to allow a PDP (or its agent, a PRP) to eliminate policies efficiently if they do not
638 apply to the current authorizationDecisionQuery. Such an element can be used to index policies
639 by Subject or Resource/Action (where some policies will need to be indexed under both Subject
640 and Resource/Action, and some policies will apply to all Subjects and/or Resource/Actions).
641 The idea is that the <target> element predicate is simple to compute, and allows the PDP (or
642 PRP) to narrow down the field of potentially applicable policies efficiently. The PDP (or PRP)
643 can then perform more complex evaluations on the smaller remaining set of policies.

644 Since the <target> element needs to be a simple predicate that is efficient to compute, it is not
645 sufficiently expressive to rule out all cases where the <policy> may not apply. For example, if
646 the policy applies only to employees who are over 55 years of age, then there is no syntax
647 currently for expressing this in the <target> element.

648 POTENTIAL RESOLUTION:

649 We need two levels of applicability predicate: one used for fast narrowing down of the set of
650 potentially applicable policies (and used for indexing), and the second for fully expressing the
651 conditions under which this policy is applicable.

652 The first level applicability predicate is our current syntax: a regular expression match on a
653 Resource/Action and Subject. It is very simple to compute, and MUST return TRUE for every
654 authorizationDecisionQuery to which the corresponding policy applies. It MAY return TRUE
655 for an authorizationDecisionQuery to which it does not apply. This predicate might be called
656 "indexApplicability" or "basicApplicability" or something similar.

657 The second level applicability predicate is an optional new element in the <applicablePolicy>. It
658 may use any comparison of attributes and values that could be used in the policy itself. This
659 predicate might be called "fullApplicability" or something similar. This second level predicate is
660 optional because for many policies, only the first level predicate may be required to fully capture
661 the exact set of conditions under which the policy applies.

662 A policy evaluation returns "NOT-APPLICABLE" if either the first level applicability predicate
663 OR the second level applicability predicate evaluates to FALSE. The second level predicate

664 need be computed ONLY IF the first level predicate evaluates to TRUE.

665 The <policy> element may assume that the first and second level applicability predicates have
666 been evaluated to TRUE. This may save some duplicate predicates.

667 Champion: Simon G.

668 Status: Open

669 **ISSUE:[PM-2-03: Meaningful Actions]**

670 There are pairings <resource,actions> which are not meaningful (e.g., execute a PDF file)
671 [Simon G.]. Should we control resource/action bindings in the language or refer to an external
672 authority?

673 Potential Resolutions:

674 [Tim] The administrative model in Figure 9 deals with this question, placing it out of scope for
675 the schema. If we do need to tackle this, I suggest leaving it for a later version.

676 [Tim] The XACML syntax shall not address the question of which actions are valid for a
677 particular resource classification. This matter shall be left for implementations to solve in a non-
678 standard way. [PM-2-03]

679 Champion: Simon G.

680 Status: Open

681 **ISSUE:[PM-2-04: Indexing Policy]**

682 Also related to target are indexing issues and how to retrieve, given a request, the applicable
683 policy for it [Tim].

684 Potential Resolutions:

685 [Tim] Section 6.4 of version 0.8 of the language proposal is reserved for tackling this question in
686 the LDAP case. Do we need to tackle other cases?

687 [Tim] The XACML specification shall provide normative, but non-mandatory to implement, text
688 that profiles LDAP for distribution of XACML instances. [PM-2-04]

689 [Tim] The XACML specification shall provide normative, but non-mandatory to implement, text
690 that profiles "the Web" for distribution of XACML instances. [PM-2-04]

691 Champion: Tim

692 Status: Open

693 **ISSUE:[PM-2-05: Ensuring Completeness]**

694 The applicable policy is defined as the ``complete" set of policies that apply to a resource. How
695 do I ensure completeness (meaning no two targets should intersect?)

696 Potential Resolutions:

697 [Tim] This is a job for the PRP and should (I think) be out of the scope for our specification. The
698 PRP has to be configured with the names and locations of the PAPs whose policies it recognizes.

699 [Tim] The XACML syntax shall not address the question of ensuring that "applicable policy" is
700 complete. This matter shall be left for PRP implementations to solve in a non-standard way.

701 [PM-2-05]

702 Proposed Resolution:

703 1. If a Base Policy is included in the Access Request, then that Base Policy is the only one that
704 will be applied to the Access Request. Otherwise,

705 2. If a PDP has a single Base Policy, then the PDP's Base Policy specifies the complete
706 <applicablePolicy> that will be used by that PDP in evaluating an Access Request. This
707 <applicablePolicy> may actually be a tree of <applicablePolicy> statements, where additional
708 statements are logically incorporated by the use of <referencedPolicy> predicates.

709 In this case, there are no overlapping targets. If the PDP's Base Policy has an empty "target"
710 element, then all Access Requests are evaluated against the <policy>. If the Base Policy has a
711 non-empty "target" element, then any Access Request that does not match the "target" returns a
712 result of "NOT-APPLICABLE" (=SAML INDETERMINATE). If the Access Request matches
713 the "target", then the result of the Access Request is the result of evaluating the <policy>.

714 3. If a PDP has multiple Base Policies, then the PDP must specify and publish its algorithm for
715 deciding which Base Policies to evaluate, in which order, and how target overlaps are resolved.

716 Vote:

717 2/21 It was agreed that this could be closed, but the **resolution has to be worded to be**
718 **consistent with the new glossary**. This it was not voted closed.

719 3/7 Discussed and is not ready to be closed

720 Champion: Pierangela

721 Status: Open

722 **ISSUE:[PM-2-06:Encapsulation of XACML policy (was Policy Security)]**

723 Resolution 4: An XACML "applicable policy" will contain its own security features (e.g.

724 signature), rather than relying on an encapsulating saml assertion.

725 Potential Resolutions:

726 [Anne] XACML will be specified in two separate layers.

727 1. The first layer is the <applicablePolicy> syntax, and will contain no security provisions such
728 as authentication (signature), integrity protection, or encryption.

729 2. The second layer is a specification of how the first layer can be embedded in another
730 mechanism for security protection. The XACML TC will define such a mechanism using an
731 encapsulating SAML assertion. OASIS members are free to propose other mechanisms, such as
732 encapsulating an <applicablePolicy> inside an X.509 Attribute Certificate.

733 Implementations may be compliant with the first layer only, with both the first layer and with the
734 XACML TC-defined second layer, or with the first layer and another specified mechanism for
735 the second layer. Implementations must state which level of compliance they support.

742 Champion: Tim

743 Status: Open

744 [ISSUE:\[PM-2-08: Outcome of policies and their combination\]](#)

745 *[Probably related to several other issues]*

746 Proceedings on the discussion started at the F2F meeting, it is noted that outcome of policies is
747 not only YES or NO but can have an alternative ``not applicable" value, to this another possible
748 value ``error" seems to be needed. Anne also reports on her proposal (previously circulated via
749 email) about the use of ``if ... then.. `` rule for expressing policies. In her proposal the ``IF"
750 identifies the request to which a rule applies, if a request satisfies that then if the boolean
751 expression in the THEN part is satisfied the response is ``allow" otherwise it is ``deny". If the IF
752 part is not satisfied the response should be ``not applicable". There is a discussion on what ``not
753 applicable" means. Hal points out the need for a default policy, to be applied if no target applies
754 to the request. Tim points out that if the PEP sends a request to the PDP the PDP should return

755 an error. Hal says that SAML would return a msg saying "indetermined status". Ernesto
756 proposes defining an order on these values so that boolean operators can be applied as usual (and
757 and or retain the usual behavior as long as the values on which they operate are organized in a
758 lattice). The discussion proceeds on the different types on values and on what the intended
759 combination should be. For instance, what should be the result between ``not applicable" AND
760 ``true". The multivalued scheme that Ernesto is thinking of captures 4 values: false, true, lack of
761 information, and not applicable. Ernesto and Polar say they will be thinking more about a
762 possible lattice. Pierangela notes that there appears to be confusion in the policy combination
763 since the current proposal does not distinguish between predicate evaluation and policy outcome.
764 A predicate (i.e., one condition appearing in a rule) can either evaluate ``false" ``true" or
765 ``notknown" (in case the attribute is not provided). A policy can instead provide answers like
766 ``allow" ``deny" or ``don't care". The way we deal with ``notknown" predicate evaluation and
767 ``don't care" policy decisions should not be the same. It might be possible to combine predicate
768 evaluation and policy evaluation (as Anne notes policies can be nested, so a policy could appear
769 where a predicate can) but we must be careful on how we combine them. Also ``don't care" in
770 policy decision means that we allow a policy to speak out in three different ways (and we should
771 have a way to express that), this is independent from the ``not know" in the predicate evaluation.

772 Potential Resolutions:

773 ???

774 Champion: Ernesto/Polar

775 Status: Open

776 **Group 3: Policy Composition**

777 Assuming an Applicable Policy can refer to several Policy elements, we need to answer the
778 following questions:

779 **ISSUE:[PM-3-01: Combining Policy Elements]**

780 How are the Policy Element combined? For instance, we could support Boolean expressions of
781 policies. E.g., if there are three policies by independent issuers, I can say ``P1 AND (P2 OR P3)?
782 This could fit well in the multiple issuers scenario Anne was envisioning. Should this be part of
783 the core of the extension (external URI [Michiharu])?

784 Potential Resolutions:

785 [Tim] We could add "policy" to the "sequence" in "rule". Then we would have to give policies
786 unique identifiers, not just string names. Perhaps, we should add "applicable policy", instead of
787 "policy".

788 [Tim] An XACML "applicable policy" will not reference external "applicable policies".

789 However, it may "incorporate" external "applicable policies". [PM-2-01] [PM-3-01] [PM-5-03]

790 [Tim] An XACML "applicable policy" shall be capable of referencing an external "applicable
791 policy", providing explicit rules for combining such policies. [PM-2-01] [PM-3-01] [PM-5-03]

792 Champion: Michiharu

793 Status: Open

794 [ISSUE:\[PM-3-02: Specifying Policy Outcome\]](#)

795 How the policy outcome should be specified. Possibilities are 2-valued (access decision is
796 ``grant"/"deny") or 3-valued (policy outcome is ``grant"/"deny"/nothing). Note the ``nothing"
797 means that no rule applies, to be solved according to default. (Related work on composition...?)

798 How does the PEP interpret the answer I don't know?

799 Potential Resolutions:

800 [Tim] Ultimately, the PEP has to know whether or not to grant access. So, someone has to
801 decide, and (by definition) it is the PDP. So, the "don't care" response isn't helpful. However,
802 saml should have an error code to indicate that the PDP is not the appropriate PDP to render a
803 decision on a particular request.

804 [Tim] The XACML specification shall specify when a PDP should return saml:decision
805 attributes with the values "permit" and "deny". If the PDP is unable to render a decision, then a
806 saml status code shall be returned. No decision value shall be supplied in this case. [PM-3-02]

807 Champion: Simon

808 Status: Open

809 [ISSUE:\[PM-3-03: multiple Base Policies\]](#)

810 Can a PDP have more than one Base Policy?

811 Potential Resolutions:

812 Alternative 1:

813 A PDP MAY have multiple Base Policies, but such Base Policies SHOULD have non-
814 overlapping <xacml:target> elements. The XACML specification does not specify the order in
815 which multiple Base Policies are evaluated, or the result if two or more Base Policies have
816 overlapping <xacml:target> elements.

817 A PDP that has multiple Base Policies MUST publish its algorithm for the order in which Base
818 Policies are evaluated and the result where two or more Base Policies have overlapping

819 <xacml:target> elements.

820 Alternative 2:

821 Base Policies have restricted <target> elements that are easily compared for overlap. In this
822 alternative, the case where base policies overlap is an ERROR. Note that the 0.8 syntax favors
823 this alternative and allows Alternative 3.

824 Alternative 3:

825 There is only one Base Policy. Either it has no <target>, and applies to all Resources or it has a
826 <target> element that specifies the set of resources which this PDP is prepared to handle and
827 returns NOT-APPLICABLE if a resource does match that target.

828 Champion: Anne (who supports Alternative 3)

829 Status: Open

830 [ISSUE:\[PM-3-03: default PDP result\]](#)

831 If no Base Policy applies to a given Access Request (i.e. all Base Policy evaluations return NOT-
832 APPLICABLE), does the PDP return NOT-APPLICABLE (=SAML INDETERMINATE) to the
833 PEP, or is the PDP configured with a default result to return (e.g. TRUE or FALSE)?

834 Potential Resolution:

835 If no Base Policy applies to a given Access Request, then the PDP returns NOT-APPLICABLE
836 (=SAML INDETERMINATE) to the PEP.

837 Champion: Anne

838 Status: Open

839

840 **Group 4: Syntax**

841 [ISSUE:\[PM-4-01: Triplet Syntax \(was Syntactic Sugar\)\]](#)

842 The current schema assumes authorizations are specified as a pre-condition which is an
843 expression made of predicates on SAML attributes (conditions on principal, resource and
844 environment can be interspersed), let's call it Option ``pre-cond" [Carlisle, Tim, Anne, ...]. In the
845 last conference call it was agreed to leave as an open issue whether to group conditions about
846 principal, resource, and environment in three different elements, let's call it Option ``triplet"
847 [Michiharu, Ernesto, Simon,]. The argument for Option ``pre-cond" is that there are
848 predicates that involve both principal and resource attributes (e.g., an authorization that states

849 that users can read the files they own). The counter-objection to this is that you can naturally
850 include all predicates on resources in the resource condition element (which can also refer to
851 principal attributes). The argument for the triplet is that it makes authorization specifications
852 conceptually clearer and closer to current approaches.

853 [Tim] In the 0.8 schema, valueRef has an attribute to indicate the entity to which it applies
854 (principal, resource, etc.). It only has to be consulted if the attribute type identifier is ambiguous.

855 Potential Resolutions:

856 [Tim] The XACML syntax will differentiate between model entities (principal, resource, etc.) in
857 its attribute elements, rather than in its rule elements. [PM-4-01]

936 Champion: Tim

937 Status: Open

938

939 **Group 5: SAML Related**

940 In the current schema attributes on resources and principals, which can be used in the Target (for
941 resources) and in predicates, are retrieved using URIs pointing to SAML dataflow.

942 [ISSUE:\[PM-5-01: Non-SAML Input\]](#)

943 Can this mechanism be extended to point to non-SAML authorities as required in the Java
944 environment [Sehkar]?

945 At a minimum, extending SAML expressions but broader to other authorities.

946 Potential Resolutions:

947 [Tim] The XACML specification shall be closely coupled to saml entities. However, the use of
948 saml namespace identifiers is not intended to imply that all attributes must be retrieved from
949 saml messages and assertions. [PM-5-01]

950 Champion: Sehkar

951 Status: Open

952 [ISSUE:\[PM-5-02: Wildcards on Resource Hierarchies\]](#)

953 How do we express wildcards on the resource hierarchies [Simon G.]?

954 The current schema includes ResourceToClassificationTransform to this purpose. Is this
955 sufficient?

956 Potential Resolutions:

957 [Tim] We should register an OASIS identifier for the use of regular expressions in this context.

958 [Tim] The XACML syntax shall use registered URIs to identify algorithms for processing
959 resource classification wildcards. [PM-5-02]

960 Tied to outcome of resolution PM-5-14

961 Proposed Resolution:

962 Use "ResourceToClassificationTransform". Register a URI with OASIS for the use of regular
963 expressions in this context. Other transform algorithms may be specified by the use of other
964 URIs to be registered with OASIS.

965 Champion: Simon G.

966 Status: Ready to Close

967 [ISSUE:\[PM-5-03: Roles and Group Hierarchies\]](#)

968 Are roles and groups hierarchies available via SAML [Simon G.]? Hierarchies could be needed,
969 in case of support of negative rules, for resolving conflicts based on more-specific-takes-
970 precedence. Note: policy resolution conflicts fit well when the principal is a group, they may be
971 difficult to apply in case of principal's expressions.

972 Potential Resolutions:

973 [Tim] An XACML "applicable policy" will not reference external "applicable policies".
974 However, it may "incorporate" external "applicable policies". [PM-2-01] [PM-3-01] [PM-5-03]

975 [Tim] An XACML "applicable policy" shall be capable of referencing an external "applicable
976 policy", providing explicit rules for combining such policies. [PM-2-01] [PM-3-01] [PM-5-03]

977 Proposed Resolution:

978 XACML will not support role and group hierarchies in the policy language. Attribute authorities
979 may support role and group hierarchies.

980 Champion: Simon G.

981 Status: Closed

982 [ISSUE:\[PM-5-04: SAML Assertions URI\]](#)

983 From the schema it seems that expressions are predicates whose arguments are always URI or
984 value. Are SAML assertions always URI?

985 Potential Resolutions:

986 [Tim] Attributes in saml assertions are identified by a namespace, which is a URI, and a name,
987 which is a string.

988 Simon suggests that the current solution is in general enough, as the URI+XPath combination
989 specifies a schema (via the URI) and allows to retrieve a value (via the XPath). XPaths guarantee
990 that values are uniquely identified. This technique smoothly applies not only to SAML but also
991 to other formats like LDAP.

992 Hal observes that this is not always the case, as there may be attribute namespaces which are not
993 URI.

994 Anne remarks that besides a pointer to the schema, a pointer to an instance is also needed. Simon
995 agrees to provide a full explanation of this scenario at the F2F.

996 This issue conflates two separate issues:

- 997 1. Are SAML assertions always URI?
- 998 2. references to attributes in XACML predicates. (See new issue PM-1-04)

999 Proposed Resolution:

1000 Attributes in SAML assertions are identified by a namespace, which is a URI, and a name, which
1001 is a string.

1002 Champion: Simon

1003 Status: Closed

1004 [ISSUE:\[PM-5-05: XPath\]](#)

1005 Use of Xpath for identifying SAML constructs and the use of Xpath operators

1006

1007 Potential Resolutions:

1008 Simon clarifies that the position he will take is that while the use of Xpaths to extract nodeset is
1009 just fine, they do not make good values in expression. The solution in the current schema is
1010 cleaner.

1011 Anne offers to look into the issue to provide an alternative point of view.

1012

1013 Champion: Simon

Colors: Gray Blue Yellow

1014 Status: Open

1015 **ISSUE:[PM-5-06: Multiple actions in single request]**

1016 In the SAML issues document, [http://www.oasis-open.org/committees/security/docs/draft-sstc-](http://www.oasis-open.org/committees/security/docs/draft-sstc-core-discussion-01.doc)
1017 [core-discussion-01.doc](http://www.oasis-open.org/committees/security/docs/draft-sstc-core-discussion-01.doc)

1018 ... Issue 5.1.15.2 seeks guidance on whether multiple "actions" can be specified in a single
1019 decision request.

1020 Potential Resolutions:

1021 [Tim] I feel that XACML should answer this question and send its conclusion in a liaison to
1022 SAML. My feeling is that the answer is "No". If "applicable policy" is to be identified with the
1023 resource/action pair, then multiple "applicable policies" are involved when multiple actions are
1024 involved. Much "cleaner" for there to be a single "applicable policy" for each decision request.
1025 And, therefore, a single action per decision request. It is no great hardship to submit multiple
1026 decision requests, in the event that you need a decision for each of several actions.

1027 [Hal] Personally I am in favor of limiting this, but I will state the counter argument for the
1028 record. If the possible Actions correspond to what can be in the request, then this works fine. The
1029 only reason for multiple actions would be some sort of policy provisioning requirement.
1030 However, if the Actions are more like privileges or permission bits, and do not match allowable
1031 requests one for one, then some requests may require the AND or OR of several actions. I
1032 believe this is the motive behind suggesting multiple actions.

1033 I don't see any rush on this as we are not close to proposing changes to the decision protocol yet.

1034 Champion: Tim

1035 Status: Open

1036 **ISSUE:[PM-5-07: Delegation]**

1037 [Polar] Has anybody thought about how delegation can be reasoned about in XACML? It
1038 appears that SAML only asserts a flat list of attributes with a single principal, or am I off base
1039 here? Can I support policies on such operations as:

1040 Paul for Peter says debit Peter's account?

1041 Which mean that Paul (or some other party trusted to do so) has issued Paul the authorization to
1042 act on behalf of Peter, in this case to access Peter's account. Or such things, like WebServer
1043 quoting JohnDoe says lookup in customer database. Where the WebServer may be trusted to
1044 authenticate JohnDoe, but no such proof is necessary other than the WebServer merely claiming
1045 to be acting on JohnDoe's behalf?

1046 Potential Resolutions:

1047 [Hal] With regards to SAML, the Access Decision Request was deliberately kept simple with the
1048 idea that XACML would give us the tools to do the job properly. I have proposed (see my use
1049 cases) that XACML not only be able to express policies, but the method of expressing policy
1050 inputs be rolled back into the SAML Access Decision Request (and Assertion).

1051 In my opinion, XACML policies should be able to contain predicates about zero or more of the
1052 following subjects:

1053 Requestor Subject

1054 Recipient Subject (can be different from requestor)

1055 Intermediary Subject (can be more than one for a given request)

1056 I propose a single construct for Subjects and their attributes and some kind of modifier indicating
1057 the type (refrain from using "role" here) of subject.

1058 [Tim] Delegation could be expressed in attribute assertions. The very issuance of an attribute
1059 assertion is a form of delegation. So, XACML should not have to concern itself with the process
1060 by which an entity obtained an attribute.

1061 Champion: Polar/Hal

1062 Status: Open

1063 **ISSUE:[PM-5-08: saml:Action is a "string"]**

1064 These are some of the potential SAML issues. Most of them were found when attempting to
1065 write J2SE policy files in XACML syntax. Further discussion is needed on these issues.

1066 saml:Action is currently specified as a "string". Making Action an abstract type would allow it
1067 to be extended. This would allow the content model to be defined by a schema external to the
1068 SAML spec.

1069 Thus what constitutes an action could be determined by the J2SE schema.

1070 Potential Resolutions:

1071 [Toshi] In SAML, saml:Action is used only in saml:Actions and saml:Actions have Namespace
1072 as an attribute. So it is possible to write action(s) such as:

1073 <saml:Actions Namespace="urn:J2SEPermission:java.io.FilePermission">

1074 <saml:Action>write</saml:Action>

1075 </saml:Actions>

1076 or

```
1077 <saml:Actions Namespace="urn:J2SEPermission">
1078   <saml:Action>java.io.FilePermission:write</saml:Action>
1079 </saml:Actions>
```

1080 But it will be useful if we can write something like:

```
1081 <saml:Action>
1082   <J2SEPermission class="java.io.FilePermission">write</J2SEPermission>
1083 </saml:Action>
```

1084 Champion: Sekhar

1085 Status: Open

1086 [ISSUE:\[PM-5-09: saml:AuthorizationQuery requires actions\]](#)

1087 If actions are optional for XACML, then why should <saml:Actions> be required in
1088 <saml:AuthorizationQuery> ? Both the wording in the SAML assertions draft as well as the
1089 SAML schema places such a requirement. saml:Actions should be optional in the
1090 AuthorizationQuery to accommodate queries without actions. At least for now, I don't anticipate
1091 this as an issue for J2SE.

1092 Potential Resolutions:

1093 [Toshi] In the latest SAML spec (core-25), AuthorizationDecisionQuery element has Resource
1094 attribute and Actions element and both of them are "required". Does this cause many problems?

1095 (Resource attribute is "optional" for AuthorizationDecisionStatement element.)

1096 As for J2SE case, I think there is an issue in terminology.

1097 Champion: Sekhar

1098 Status: Open

1099 [ISSUE:\[PM-5-10: single subject in AuthorizationQuery\]](#)

1100 [editor note: Is this issue covered somewhere else?]

1101 saml:AuthorizationQuery currently only contains a single Subject. While a saml:Subject can
1102 support multiple NameIdentifier or SubjectConfirmation or AssertionSpecifier elements, it is
1103 required that they all belong to the same principal. So a single subject cannot be used for
1104 unrelated principals. In J2SE, there is a need to base access control on multiple principals which
1105 are not related and this therefore points to a need for more than one Subject in the
1106 saml:AuthorizationQuery

1107 Potential Resolutions:

1108 The way out of this appears to be extend SubjectQueryAbstractType.

1109 Champion: Hal

1110 Status: Open

1111 [ISSUE:\[PM-5-11:XACML container in SAML\]](#)

1112 Issue: should we use a SAML assertion as a container for an XACML applicable policy?

1113 Potential Resolutions:

1114 ???

1115 Champion: Tim

1116 Status: Open

1117 [ISSUE:\[PM-5-12:derive attribute from saml:AttributeValueType\]](#)

1118 Issue: Should we derive the attribute from saml:AttributeValueType? This seems to make sense,
1119 but the resulting attribute will have to become an element, with start and stop tags, making it
1120 larger and less readable.

1121 Potential Resolutions:

1122 ???

1123 Champion: Tim

1124 Status: Open

1125 [ISSUE:\[PM-5-13: Base Policy supplied as part of AuthorizationDecisionQuery\]](#)

1126 Some PEPs have knowledge of the policy associated with a resource (example: a typical
1127 FileSystem knows the ACLs associated with a file or directory). To support this case, can a Base
1128 Policy or <referencedPolicy> be supplied as part of the SAML AuthorizationDecisionQuery?

1129 Possible Resolutions:

1130 Default policy:

1131 A Base Policy or <referencedPolicy> for evaluating a particular Access Request may be
1132 specified as part of the Access Request. If a PDP has no Base Policy(s), then the result of
1133 evaluating an Access Request that does not specify a Base Policy to use is NOT-APPLICABLE

1134 (=SAML INDETERMINATE).

1135 Champion: Anne

1136 Status: Open

1137 **ISSUE:[PM-5-13: Resource Structure]**

1138 Simon proposes that the resource be written in a request-independent manner. The point that
1139 Simon makes in that while in SAML the resource is just a string, XACML should suggest a
1140 structure.

1141 Hal comments that while it is good to retain a simplified structure, we should not be tied to
1142 SAML as a specific way of expressing requests. In other words, we need to be compatible with
1143 SAML, but should not be tied to it. Carlisle, replies that we actually have that in the charter. Hal
1144 says we should be compliant, but we should ask SAML to define a more sophisticated request.

1145 Simon says that the SAML way of expressing resources as a string is limited. For instance, what
1146 is the resource in case of XML documents? How do i go fine grained?

1147 Ernesto comments that we should not have a sophisticated resource encoding if SAML does not
1148 support it. This can be a parallel effort to influence the next version of SAML.

1149 Potential Resolutions:

1150 Champion: Simon

1151 Status: Open

1152 **ISSUE:[PM-5-15: Attribute reference tied to object]**

1153 Simon comments that attribute reference should be tied to the object. It's a question of tight
1154 coupling or loose coupling of the policy with the request. (This issue will be discussed in
1155 relationship with PM-5-14)

1156 Potential Resolutions:

1157 Champion: Simon

1158 Status: Open

1159 **ISSUE:[PM-5-16: Arithmetic Operators]**

1160 The issue was discussed at the F2F where Sekhar said he would have looked at it. Sekhar reports
1161 that he could not complete it. Hal comments that we will need black box functions. for instance
1162 matching a subject requestor to something in a record that requires some sort of private
1163 functions: no set of simple operators that we can define that will be good enough. Ernesto, while

1164 agreeing on this, comments that it would be useful to have at least the simplest arithmetic
1165 operators be part of the language.

1166 Potential Resolutions:

1167 Champion: Ernesto, Simon, Tim

1168 Status: Open

1169 [ISSUE:\[PM-5-17: Boolean Expression of rules \]](#)

1170 The current proposal in the document that a policy could be a boolean expression of rules.
1171 Pierangela points out that semantics of such a boolean expression seems to be not clear and while
1172 boolean expressions (or rather AND and OR) seems to be needed for combining policies they
1173 seems not to be for combining rules within an elementary policy.

1174 Potential Resolutions:

1175 Champion: Pierangela

1176 Status: Open

1177

1178 **Group 6: Predicate Cononicalization**

1179 [ISSUE:\[PM-6-01: SAML Assertions URI\]](#)

1180 Values used in predicates can refer to various standard formats (e.g, X.509 [Anne]) that could
1181 make the predicates evaluation difficult. For instance, if a principal's name is expressed in X.500
1182 syntax you cannot compare it against a simple string. How do we make the representations
1183 canonical?

1184 Potential Resolutions:

1185 [Tim] Policy environments have to use consistent type definitions for the attributes they use.

1186 Champion: Anne

1187 Status: Open

1188 **Group 7: Extensibility**

1189 [ISSUE:\[PM-7-01: XACML extensions\]](#)

1190 XACML Extension Model that defines what portion of the XACML specification is a core and

1191 to what extent the XACML specification can be extended. Based on this proposal, XACML
1192 policy administrators can represent much broader access control policies by extending the core
1193 portion of the XACML specification.

1194 This extension model is designed to support an XACML extensibility property stated in the
1195 XACML charter. This proposal is based on the current language proposal document but includes
1196 several modifications.

1197 Potential Resolutions:

1198 See <http://lists.oasis-open.org/archives/xacml/200112/msg00076.html>

1199 Champion: Michiharu

1200 Status: Open

1201 **Group 8: Post Conditions**

1202 *This group was created out of issues raised in Michiharu's proposal for post conditions.*
1203 *See Also Issues PM-1-02 and PM-1-03 for more on post conditions*

1204 **ISSUE:[PM-8-01:] (4.1) Internal v.s. external post conditions**

1205 Proposed Resolution:

1206 XACML does not support any distinction between internal post condition and external post
1207 condition. It depends on the configuration of PEP and/or PDP. Refer to 3.3.

1208 Champion: Michiharu

1209 Status: Open

1210 **ISSUE:[PM-8-02:] (4.2) Mandatory v.s. advisory post conditions**

1211 Proposed Resolution:

1212 XACML does not support any distinction between mandatory post condition and advisory post
1213 conditions. The meaning of the post condition is determined in each application. Thus, errors and
1214 exceptions of the post conditions are not defined in XACML. Applications must define them.
1215 Refer to 3.4.

1216 Champion: Michiharu

1217 Status: Open

1218 **ISSUE:[PM-8-03:] (4.3) Inapplicable**

1219 Proposed Resolution:

1220 The post condition is not computed and executed when the binary expression is determined as
1221 inapplicable (or other undecidable cases)

1222 Champion: Michiharu

1223 Status: Open

1224 **ISSUE:[PM-8-04:] (4.4) Base policy v.s. policy reference**

1225 Proposed Resolution:

1226 The post conditions CAN be specified in the base policy as well as the policy reference. When
1227 the policy reference returns one or more post conditions, the base policy MUST deal with the
1228 returned post conditions. The possible processing rule is the following (this is subject to change):

1229 **4.4.1 Boolean expression handling**

1230 In the base policy, the processor MUST determine whether the condition holds or not
1231 regardless of the post condition.

1232 **4.4.2 Post condition handling**

1233 If the condition holds, the processor gathers all the post conditions that are attached to the
1234 TRUE conditions. If the condition does not hold, the processor gathers all the post
1235 conditions that are attached to the FALSE conditions.

1236 **4.4.3 Return final decision**

1237 After gathering all the post conditions, the processor returns Grant or Deny permission
1238 with corresponding post condition(s).

1240 Status: Open

1241 **ISSUE:[PM-8-05:] (4.5) How to return post conditions via SAML**

1242 Post conditions are stored in <condition> element of SAML authorization decision assertion.
1243 XACML provides a namespace for storing post conditions. (It would be an unbounded sequence
1244 of <operation> element.)

1245 Toshi: Though using <Conditions> element might be one option, I think it is preferable to place
1246 post conditions in <Statement> (<AuthorizationDecisionStatement>) element (but there is no
1247 room for it now).

1248 Michiharu: First I had the same idea and if such modification is accepted by SAML, that would

1249 be the ideal way to take. Actually, I tried to find alternative solution that might work under a
 1250 certain assumption. AuthorizationDecisionStatement may include validity period such as "from 1
 1251 March to 31 March" in <Conditions> element in some cases. But access decisions returned by
 1252 XACMLed PDP will not generate such restriction from the discussion in XACML so far. Thus, I
 1253 thought that <Conditions> element can be used for post-conditions. From the PEP viewpoint, it
 1254 is easy to distinguish AuthorizationDecisionStatement generated by XACMLed PDP from one
 1255 generated by other component by looking <Issuer> element etc. But I am not confident with this
 1256 usage.

1257 Bill: In my mind, this puts the responsibility of appropriate **action** on the PEP; the PDP is only
 1258 concerned with **decisions**, and those decisions are finite (within the scope of the decision
 1259 making process). personally, i think that we should proceed with the assumption that SAML will
 1260 be open to modifications to their specification--if our reasoning is sound i do not see why we
 1261 would not be able to garner support for adoption.

1262 Toshi: When we put post-conditions in <Conditions> element, we must extend SAML
 1263 <Condition> element (I noticed it today). Then how about extending SAML
 1264 <AuthorizationDecisionStatement> element? SAML allows to extend it. It will look like as
 1265 follows:

```
1266 <element name="AuthorizationDecisionWithPostConditionStatement"
1267   type="xacml:AuthorizationDecisionWithPostConditionStatementType"/>
1268 <complexType name="AuthorizationDecisionWithPostConditionStatementType">
1269   <complexContent>
1270     <extension base="saml:AuthorizationDecisionStatementType">
1271       <sequence>
1272         <element ref="xacml:PostConditions"/>
1273       </sequence>
1274     </extension>
1275   </complexContent>
1276 </complexType>
```

1277 Bill: the difference between these approaches appears to be where the PDP's responsibility ends.
 1278 as i see it, if you use the <Condition> element approach, the PDP still maintains some level of
 1279 implied responsibility for seeing that this condition is met ('registering in the post-condition
 1280 componenet'). on the other hand, extending the <AuthorizationDecisionStatement> element
 1281 releases this responsibility to the PEP ('i issue a GRANT, however i base that upon the
 1282 stipulation that **you, the PEP**, will discard this access 30 days hence.')

1283 either way, the GRANT is issued without waiting 30 days, but the latter approach appears more
 1284 in line with the concept of this being a 'stipulation' or 'constraint' rather than a 'condition' (which
 1285 to me implies that it's completion is required to generate the GRANT -- clearly not the case here)

1286 obviously, a level of implied trust is inherent in this approach (hey, if you can't trust the PEP
 1287 who can you trust? :o); this is not enforceable by the PDP, however if the behavior of the PEP is

1288 to DENY unless it can interpret (and fulfill) the stipulation, it sees that you would have a
1289 workable solution.

1290 Anne: think I agree with Bill's position on this: the PDP should be just an evaluation engine. It
1291 can not be held responsible for enforcing any actions as a result of the evaluation. Post
1292 conditions, if we use them, should just be values that are returned to the PEP and are meaningful
1293 only to the PEP. It is up to the PEP to enforce them.

1294 I think the semantics of post conditions are hard to manage in access control unless we want the
1295 PDP to be far more than an evaluation engine.

1296 The one strong argument for PDP-enforced post conditions I have heard is that certain actions
1297 should be logged by the PDP, showing exactly how the result was obtained. I think this can
1298 probably be an implementation feature for a PDP, managed by PDP configuration and outside of
1299 the scope of XACML. It is not part of a policy.

1300 Proposed Resolution:

1301 Post conditions are stored in <condition> element of SAML authorization decision assertion.
1302 XACML provides a namespace for storing post conditions. (It would be an unbounded sequence
1303 of <operation> element.)

1304 Champion: Michiharu

1305 Status: Open

1306 [ISSUE:\[PM-8-06:\] \(4.6\) When to execute post condition](#)

1307 Proposed Resolution:

1308 While post condition implies that specified operations must be dealt with prior to the requested
1309 access, it does not necessarily mean that the specified operations must be executed
1310 synchronously. Taking the obligatory operation usage scenario in 1.2 for example, it is
1311 impossible to execute "delete-in-90days" post condition prior to the requested access. It would be
1312 reasonable if such operation is queued in the application and guaranteed to be executed later.

1313 Champion: Michiharu

1314 Status: Open

1315 [ISSUE:\[PM-8-01:\] \(4.7\) Extension point](#)

1316 Proposed Resolution:

1317 XACML SHOULD support extension point in the post condition specification and semantics. It
1318 includes the process of how to determine the post condition. One example is that the processor

1319 selects the post condition that is attached to the rule of the highest priority.

1322 **Miscellaneous Issues**

1323 **Group 1: Glossary**

1324 [ISSUE:\[MI-1-01: Consistency\]](#)

1325 Pierangela mentioned something discussed in PM group that may not coincide with glossary
1326 concerning pre and post conditions.

1327 Potential Resolutions:

1328 ???

1329 Champion: Pierangela

1330 Status: Open

1331 [ISSUE:\[MI-1-02: Definition of Policy vs. Rule\]](#)

1332 In our glossary, "rule" is a predicate or a logical combination of predicates, and "policy" is a set
1333 of rules (which I've always taken to be a logical combination of rules, although the glossary
1334 doesn't explicitly say so and, from what Pierangela was saying yesterday, she took it to be a
1335 simple "OR" of rules).

1336 In the proposal that I posted last Friday, I tried to make a couple of other distinctions: a rule
1337 does not have an applicability or target element, whereas a policy does; and a rule has an explicit
1338 grant/deny indicator, whereas a policy does not.

1339 But in yesterday's call, Simon said that in his mind a rule does have an applicability element (a
1340 R-A-S triple, which may be a simplified version of the predicates contained in the rule).
1341 Furthermore, he thinks that a policy should have a grant/deny indicator (or at least grant, for
1342 now). And, as I mentioned above, Pierangela questioned whether there is any need for a policy
1343 to have a combination of rules (i.e., either it is just a combination of predicates, or it is implicitly
1344 understood that they are combined in an OR). Finally, Simon suggested that the smallest
1345 individual unit specified by XACML should be a policy.

1346 So now I really don't understand the difference between "policy" and "rule". How are they
1347 different? Do we need to distinguish between them? Do we need separate syntax for them?
1348 Why not forget about rules altogether and say that, for XACML, a logical combination of

1349 predicates, with a (possibly simplified) applicability or target element, and with an explicit
1350 grant/deny indicator, *is* a policy. No mention of rules whatsoever (except possibly in the
1351 "Related Terms" section that follows the glossary).

1352 Is this acceptable, or is there an important distinction that needs to be maintained in the syntax?

1353 Note 1) I think we still need to retain the concept of a higher-level policy (e.g., a base policy)
1354 that specifies a logical combination of sub-policy results. The sub-policies may be included or
1355 referenced.

1356 Note 2) I think it would be useful to include the concept of a meta-policy that specifies a logical
1357 combination of predicates about policy (e.g., grant/deny, or issuer, or issue date, or whatever). I
1358 don't know how else to be able to say general things like "policies from this authority always
1359 override policies from that authority", or "denies always override grants", or "policies issued in
1360 the past month always override older policies".

1361 Potential Resolutions:

1362 ???

1363 Champion: Carlisle

1364 Status: Open

1365 **ISSUE:[MI-1-03: Definition and purpose of Target]**

1366 There seems to be some confusion, at least in the mind of the scribe ;-)) but it seems to be shared
1367 by others, on the concept and the use of target. Carlisle points out that the target essentially
1368 represent a ``condition" on the access requests to which the attached policy refers and those it
1369 provides a way to avoid going into the evaluation of policies that do not apply to the request.
1370 Intuitively, a target is like a condition that should have appeared in AND with the others in all
1371 the rules in the attached policy. Hal says that target can be useful in many real life situations for
1372 specifying policies as the administrator explicitly stated to what set of access a set of rules
1373 applies.

1379 [ISSUE:\[MI-2-01: Successfully Using\]](#)

1380 XACML definition of OASIS requirement to successfully use the specification

1381 Potential Resolutions:

1382 "Successfully Using the XACML Specification"

1383 XACML is an XML schema for representing authorization and entitlement policies. However, it
1384 is important to note that a compliant Policy Decision Point (PDP) may choose an entirely
1385 different representation for its internal evaluation and decision-making processes. That is, it is
1386 entirely permissible for XACML to be regarded simply as a policy interchange format, with any
1387 given implementation translating the XACML policy to its own local/native/proprietary/alternate
1388 policy language sometime prior to evaluation.

1389 A set of test cases (each test case consisting of a specific XACML policy instance, along with all
1390 relevant inputs to the policy decision and the corresponding PDP output decision) will be devised
1391 and included on the XACML Web site.

1392 In order to be "successfully using the XACML specification", an implementation **MUST**, for
1393 each test case, have a "policy evaluation component" that can consume the policy instance and
1394 the inputs and produce the specified output.

1395 Furthermore, the implementation **MUST** have a "policy creation component" that allows it to
1396 generate schema-valid XACML policy instances that can be consumed/processed by other PDPs.

1397 Note that, aside from the XACML policy instance itself, all PDP inputs and outputs **MUST** be
1398 SAML-compliant (i.e., conform with the assertions and protocol messages defined in the SS-TC
1399 SAML specification), although other syntaxes/formats for the PDP input and output **MAY** be
1400 supported in addition to this.

1401 Champion: Carlisle

1402 Status: Closed

1403 **Group 3: Patents, IP**

1404 [ISSUE:\[MI-3-01: XrML\]](#)

1405 [Ernesto] As I recollect, OASIS requested us to evaluate whether any XACML specification
1406 might fall in the scope of patents held by others. I quote from a Dec 13th addition to
1407 announcements regarding Xerox's XrML:

1408 (<http://xml.coverpages.org/xrml.html>) :

1409 "ContentGuard's strategy appears to be to make money by licensing the technology -- whatever
1410 some outside body defines it to be. It can do this because its patents cover the idea of a rights
1411 language in general, no matter what the specifics of the language are".

1412 I know XrML has already been mentioned in our discussions from the technical point of view,
1413 but the wording of this announcements makes me suspect that we should explore the matter
1414 further from the patents' point of view.

1415 Potential Resolutions:

1416 Oasis has a specific IPR policy and ContentGuard needs to make Oasis aware of any IP as it
1417 relates to XACML or other technical committees in accordance with that policy.

1418 [Hal] Paragraph (C) of OASIS.IPR.3.2. makes the following points:

1419 If OASIS knows about something they "shall attempt to obtain from the claimant of such rights a
1420 written assurance ..."

1421 However, "results of this procedure shall not affect advancement of a specification..."

1422 Except that "The results will, however, be recorded..." and "...may also direct that a summary of
1423 the results be included in any OASIS document published containing the specification." It also
1424 says elsewhere that they will not go out of their way to find IPR that has not been drawn to their
1425 attention.

1426 Champion: Ernesto

1427 Status: Open

1428 **Group 4: Other Standards**

1429 [ISSUE:\[MI-4-01: RuleML\]](#)

1430 Should XACML look at RuleML?

1431 [Edwin] XACML folks, Since XACML is about defining "rules" for Authorization -- would it
1432 make sense to leverage work done by the RuleML folks?

1433 RuleML folks, You may want to checkout XACML as an application of RuleML. Here is a
1434 standard that will be real within the next year!]

1435 Potential Resolutions:

1436 The issue is a generic suggestion about XACML to be a possible application of a general setting
1437 for rule representation, RuleML.

1438 Anne proposes that at the F2F every suggestion of taking into account related languages should

1439 be mandatory accompanied by a presentation
1440 After a brief discussion on RuleML, the issue is voted closed. It should be deleted from the next
1441 version of the issues document
1442 Champion: Edwin
1443 Status: Closed

1444 **ISSUE:[MI-4-02: RAD]**

1445 Should XACML look at RAD?

1446 [Polar] In response to some query about the expressiveness of evaluation of policies from
1447 different places, I would like to point the group to the CORBA Resource Access Decision
1448 specification (RAD).

1449 <http://www.omg.org/cgi-bin/doc?formal/01-04-11.pdf>

1450 and we may want to include it the document repository. It has in it an Access Decision model in
1451 which not only policies are located, but also, a policy evaluation combinator is located for a
1452 particular resource. Note, there is no language component to this specification.

1453 However, it does present a model by which policy can be distributed and evaluated. A
1454 combinator, which has an interface operation of "evaluate_policies" takes the list of located
1455 policies for the resource, the attribute list of the subject, and the operation (i.e. Action) on the
1456 resource) and evaluates the decision.

1457 That way, depending the semantics of the combinator you choose for the resource, your
1458 combinator may choose to ignore, or evaluate only some policies based on the evaluations of
1459 other policies.

1460 Potential Resolutions:

1461 Polar will bring that one to the discussion, with special reference to policy combination.

1463 Status: Open

1464 **ISSUE:[MI-4-03: DSML]**

1465 Transformations from XACML to DSML

1466 [Gil] Since the last time we talked I had the chance to play with DSML a little. It seems to me
1467 that it is theoretically possible to transform an XACML policy document into a DSML document

1468 and import that document into LDAP. The DSML document could contain elements that
1469 described the (LDAP) schema necessary to store the authorization policy entries in case the
1470 target LDAP

1471 didn't already have this schema. It is also possible to export some LDAP entries into a DSML
1472 document and transform that DSML document in XACML.

1473 What I don't know (having nothing more than a cursory understanding of XSL/XSLT) is how
1474 difficult such transformations would be and if there are any "gotchas" that would keep this from
1475 really working.

1476 Potential Resolutions:

1477 [Gil] What I think the XACML spec should do is:

1478 1.) Describe the LDAP schema necessary to store authorization policies. This should be done in
1479 "LDAP fashion" with dn's, classnames, etc.

1480 2.) (if possible) Provide the XSLT necessary to transform XACML to DSML and vice versa.

1481 That way people who don't want to be bothered with DSML can work out their own way to store
1482 and retrieve XACML data to and from the defined schema.

1483 Champion: Gil

1484 Status: Open

1485 **ISSUE:[MI-4-04: Java Security Model]**

1486 Hal says he is not clear about whether XACML should be able to represent the Java security
1487 model. Gil comments that XACML would be limited if it cannot express it. Hal notes that what
1488 XACML should be able to represent are the same requirements that Java security model
1489 represents, but not necessarily in the same way (i.e., representing the same authorizations).

1490 Potential Resolutions:
