

# MULTIPOL project

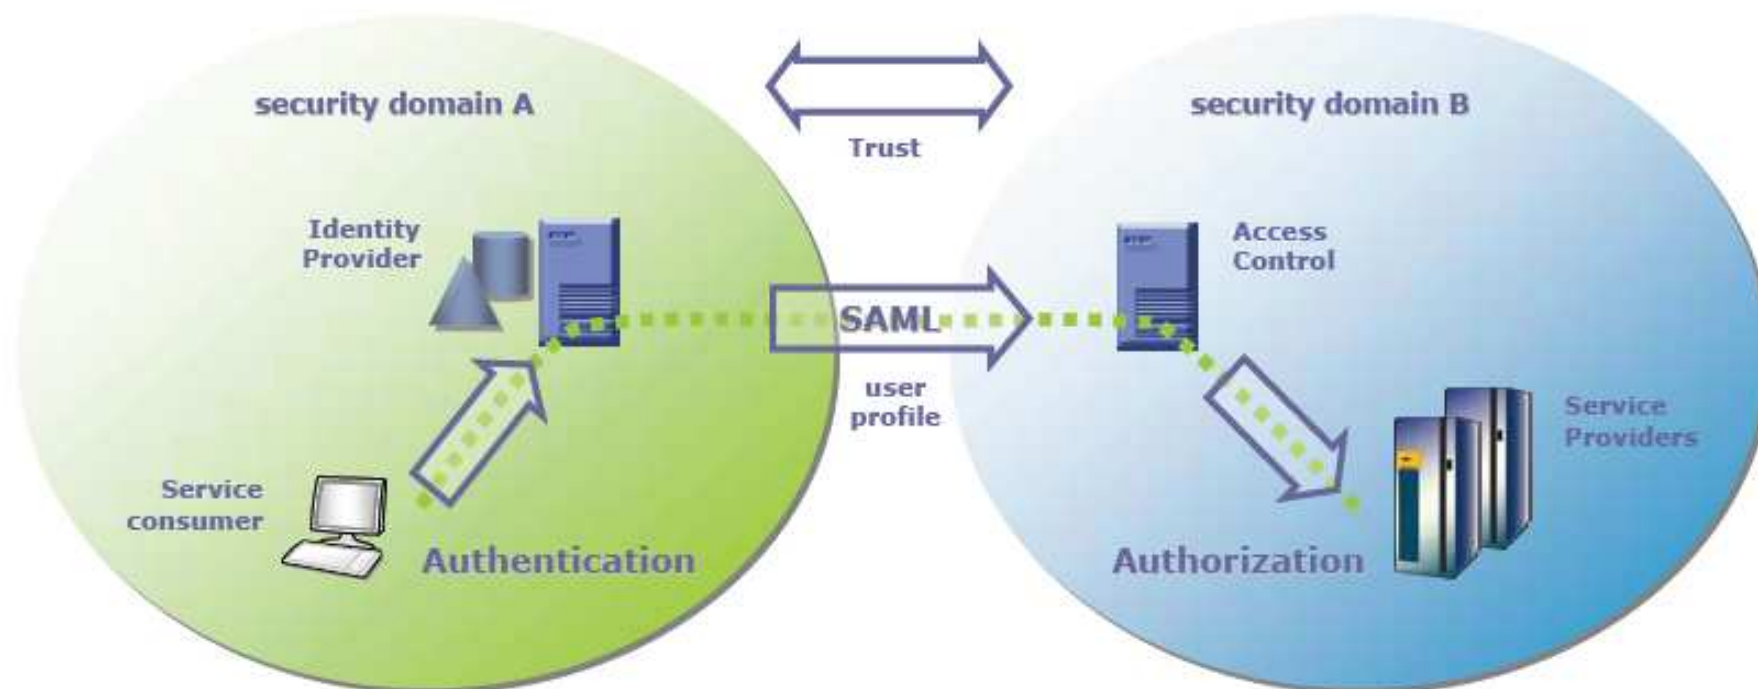

Overview for OASIS

# Motivations

- Secure the expansion of business processes beyond the usual organisations' boundaries
- Provide the essential security policy mechanisms to enforce access control
- Control the access to applications and information across security domains

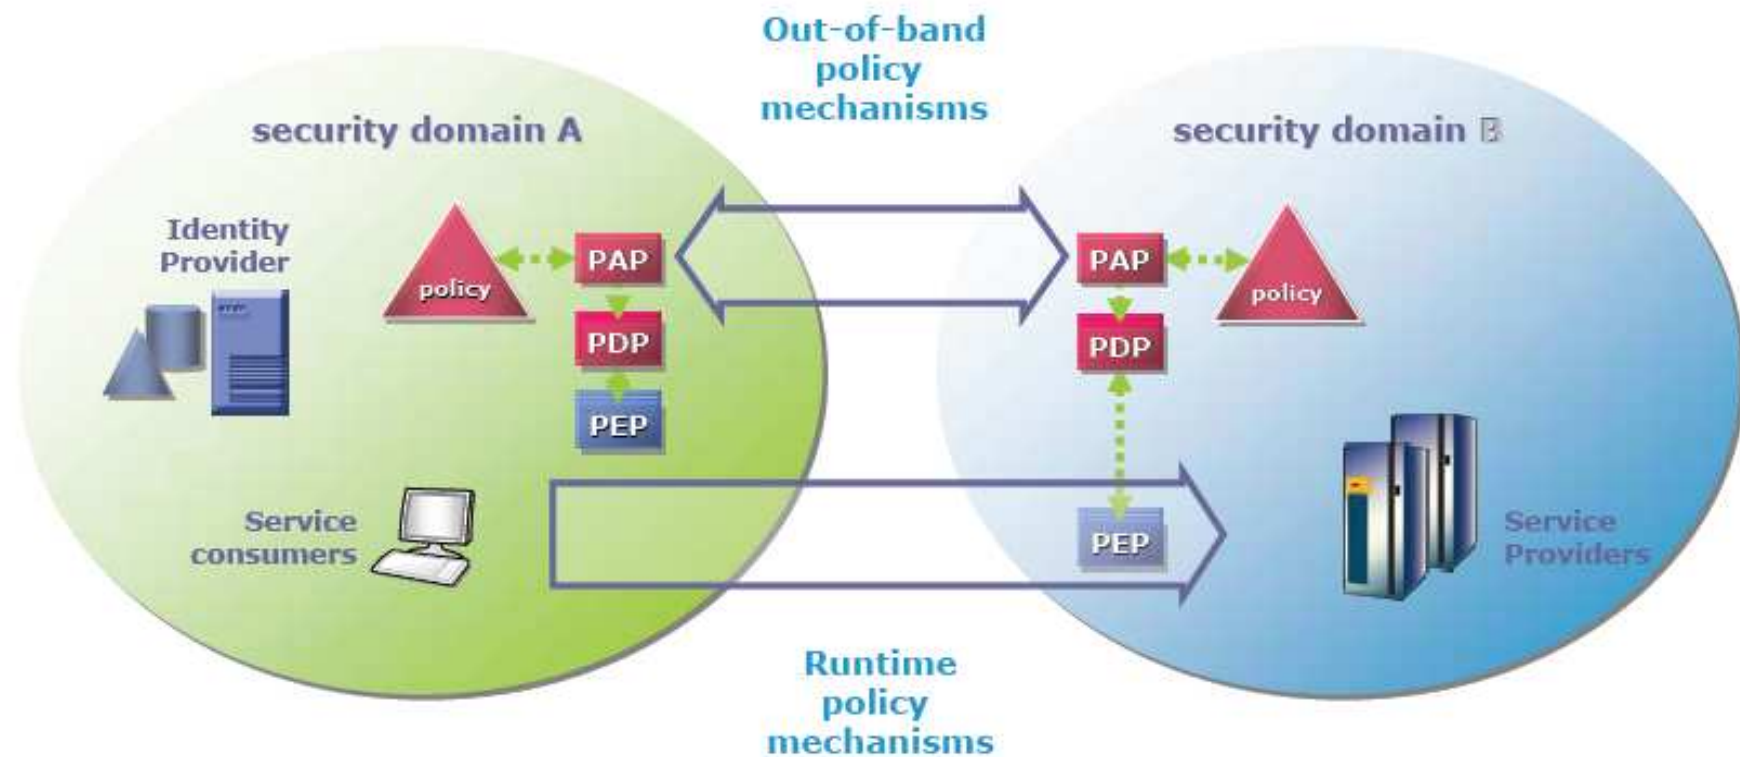

- MULTIPOL will provide an innovative, modular and consistent security suite to implement strong security features between independently-administered domains.
- It will deliver coherent authorization mechanisms, taking into account that all domains are enforcing a different security policy.

# The simple expected behaviour

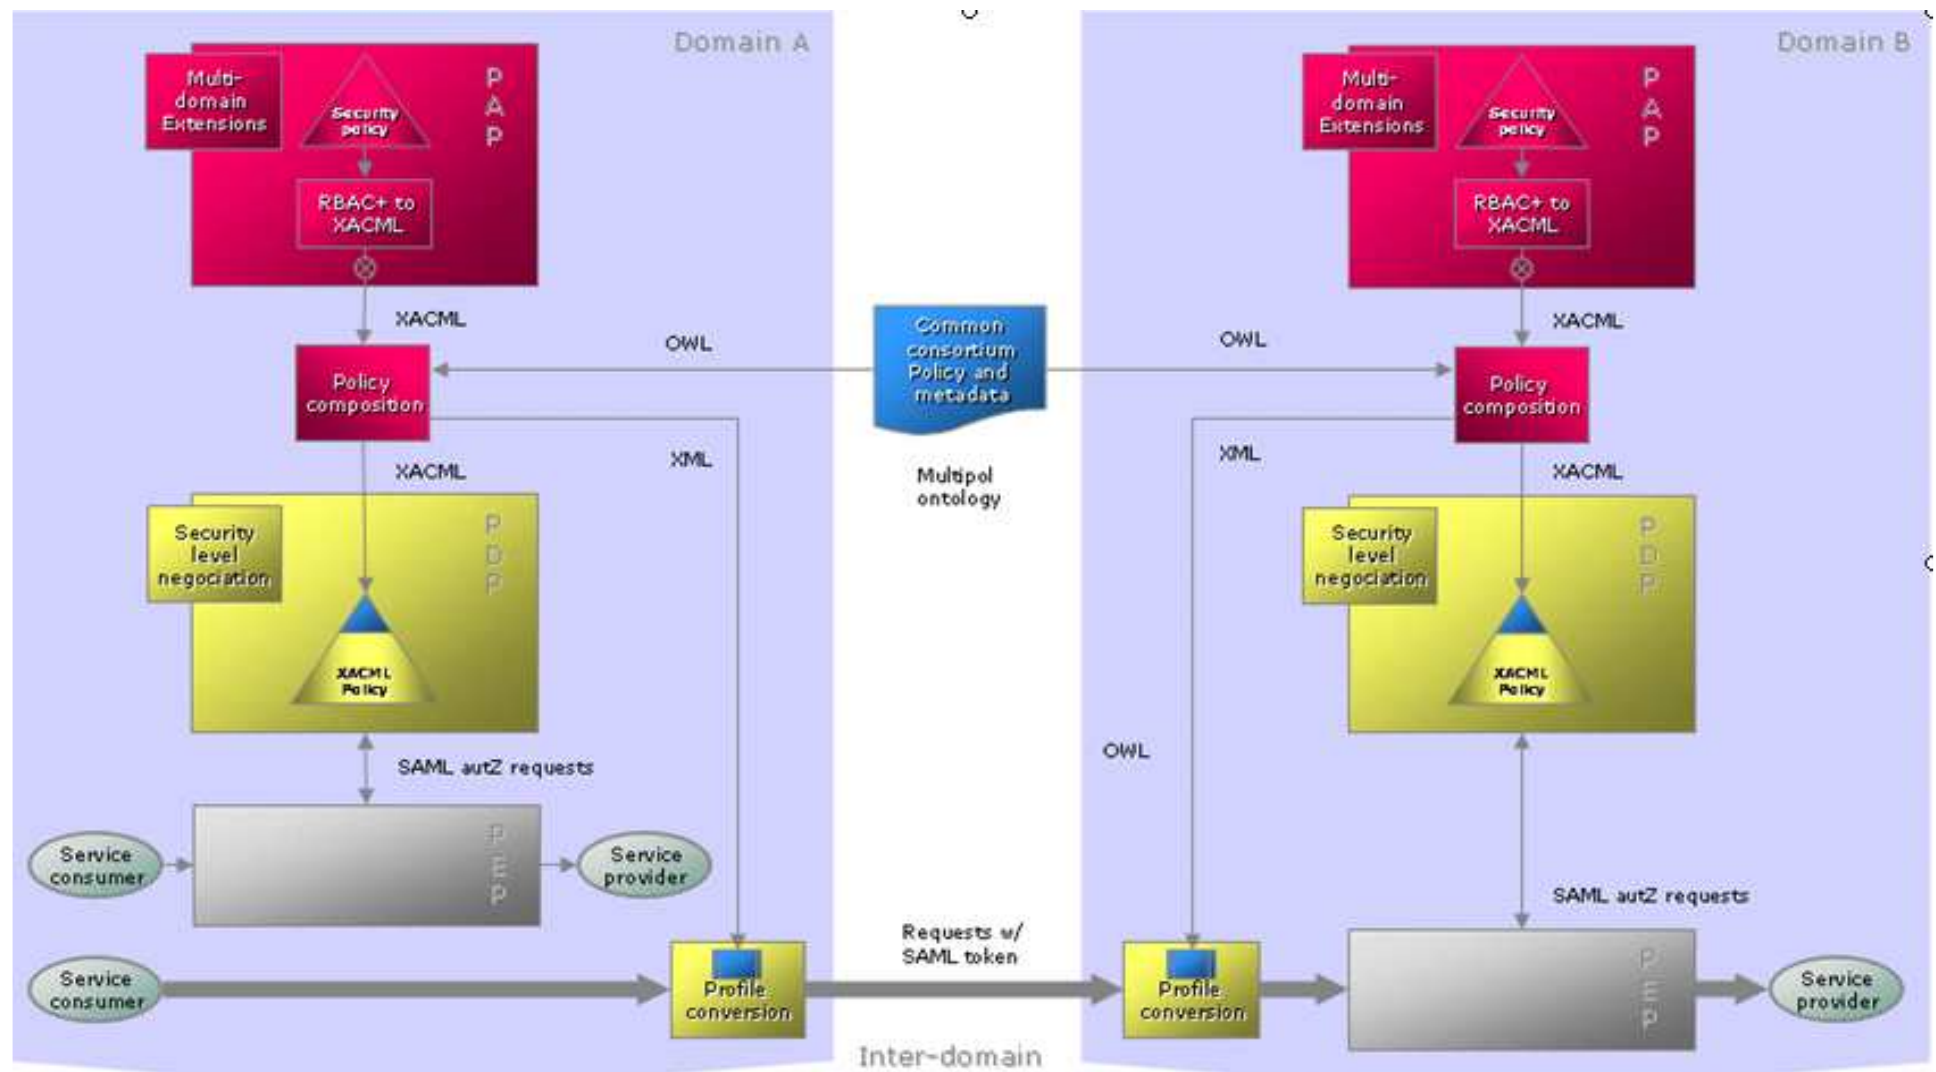

- Authorization policies are still a challenge *across* security domains

# The way towards effective inter-domain cooperation

## Architecture (not finished yet)

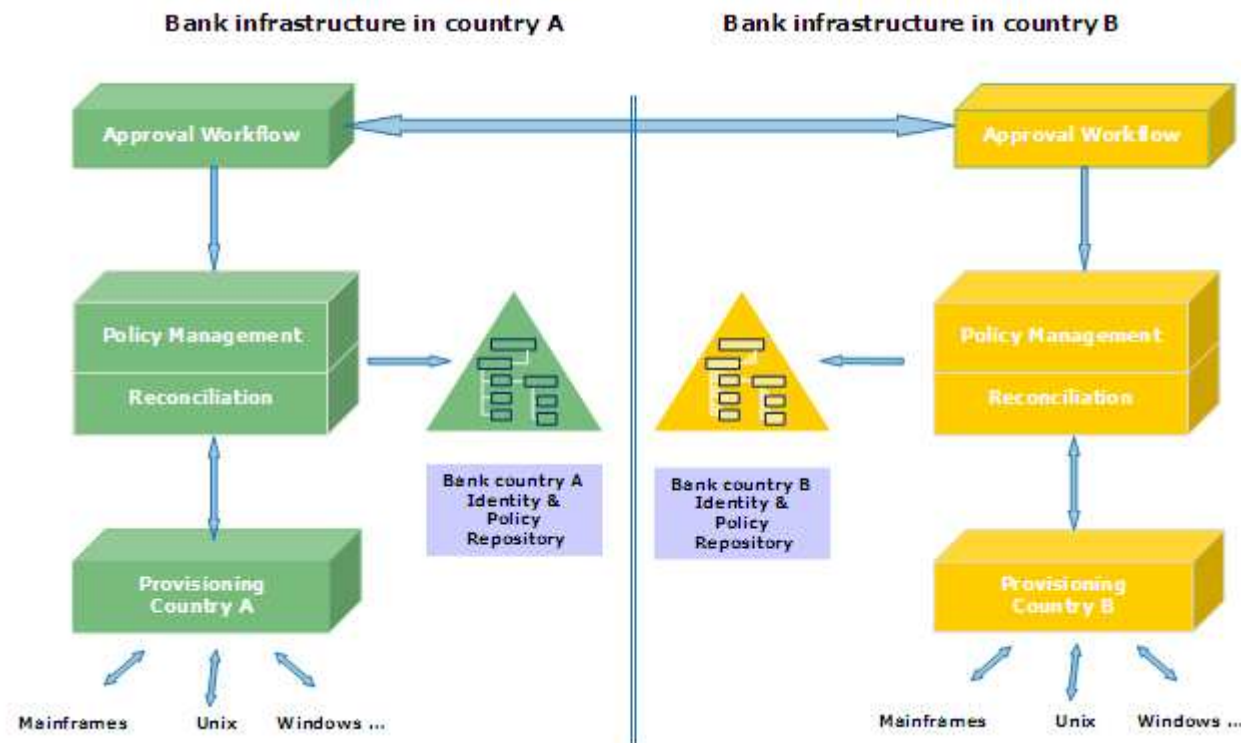

# Partners

# Partners' skills

# Use case 1: Multi National European Bank

## Use case 2: Outsourcing
