59 **xsd** – <http://www.w3.org/2001/XMLSchema>

60

61 **Abstract:**

62 The concept of human tasks is used to specify work which has to be accomplished by people.
63 Typically, human tasks are considered to be part of business processes. However, they can also
64 be used to design human interactions which are invoked as services, whether as part of a
65 process or otherwise.

66 This specification introduces the definition of human tasks, including their properties, behavior
67 and a set of operations used to manipulate human tasks. A coordination protocol is introduced in
68 order to control autonomy and life cycle of service-enabled human tasks in an interoperable
69 manner.

70

71 **Status:**

72 This document was last revised or approved by the OASIS WS-BPEL Extension for People
73 Technical Committee on the above date. The level of approval is also listed above. Check the
74 “Latest Version” or “Latest Approved Version” location noted above for possible later revisions of
75 this document.

76 Technical Committee members should send comments on this specification to the Technical
77 Committee’s email list. Others should send comments to the Technical Committee by using the
78 “Send A Comment” button on the Technical Committee’s web page at [http://www.oasis-
79 open.org/committees/bpel4people/](http://www.oasis-open.org/committees/bpel4people/).

80 For information on whether any patents have been disclosed that may be essential to
81 implementing this specification, and any offers of patent licensing terms, please refer to the
82 Intellectual Property Rights section of the Technical Committee web page ([http://www.oasis-
83 open.org/committees/bpel4people/ipr.php](http://www.oasis-open.org/committees/bpel4people/ipr.php)).

88 All capitalized terms in the following text have the meanings assigned to them in the OASIS Intellectual
89 Property Rights Policy (the "OASIS IPR Policy"). The full Policy may be found at the OASIS website.

90 This document and translations of it may be copied and furnished to others, and derivative works that
91 comment on or otherwise explain it or assist in its implementation may be prepared, copied, published,
92 and distributed, in whole or in part, without restriction of any kind, provided that the above copyright notice
93 and this section are included on all such copies and derivative works. However, this document itself may
94 not be modified in any way, including by removing the copyright notice or references to OASIS, except as
95 needed for the purpose of developing any document or deliverable produced by an OASIS Technical
96 Committee (in which case the rules applicable to copyrights, as set forth in the OASIS IPR Policy, must
97 be followed) or as required to translate it into languages other than English.

98 The limited permissions granted above are perpetual and will not be revoked by OASIS or its successors
99 or assigns.

100 This document and the information contained herein is provided on an "AS IS" basis and OASIS
101 DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY
102 WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY
103 OWNERSHIP RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A
104 PARTICULAR PURPOSE.

105 OASIS requests that any OASIS Party or any other party that believes it has patent claims that would
106 necessarily be infringed by implementations of this OASIS Committee Specification or OASIS Standard,
107 to notify OASIS TC Administrator and provide an indication of its willingness to grant patent licenses to
108 such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that
109 produced this specification.

110 OASIS invites any party to contact the OASIS TC Administrator if it is aware of a claim of ownership of
111 any patent claims that would necessarily be infringed by implementations of this specification by a patent
112 holder that is not willing to provide a license to such patent claims in a manner consistent with the IPR
113 Mode of the OASIS Technical Committee that produced this specification. OASIS may include such
114 claims on its website, but disclaims any obligation to do so.

115 OASIS takes no position regarding the validity or scope of any intellectual property or other rights that
116 might be claimed to pertain to the implementation or use of the technology described in this document or
117 the extent to which any license under such rights might or might not be available; neither does it
118 represent that it has made any effort to identify any such rights. Information on OASIS' procedures with
119 respect to rights in any document or deliverable produced by an OASIS Technical Committee can be
120 found on the OASIS website. Copies of claims of rights made available for publication and any
121 assurances of licenses to be made available, or the result of an attempt made to obtain a general license
122 or permission for the use of such proprietary rights by implementers or users of this OASIS Committee
123 Specification or OASIS Standard, can be obtained from the OASIS TC Administrator. OASIS makes no
124 representation that any information or list of intellectual property rights will at any time be complete, or
125 that any claims in such list are, in fact, Essential Claims.

212		

213 1 Introduction

214 *Human tasks*, or briefly *tasks* enable the integration of human beings in service-oriented applications.
215 This document provides a notation, state diagram and API for human tasks, as well as a coordination
216 protocol that allows interaction with human tasks in a more service-oriented fashion and at the same time
217 controls tasks' autonomy. The document is called Web Services Human Task (abbreviated to WS-
218 HumanTask for the rest of this document).

219 Human tasks are services "implemented" by people. They allow the integration of humans in service-
220 oriented applications. A human task has two interfaces. One interface exposes the service offered by the
221 task, like a translation service or an approval service. The second interface allows people to deal with
222 tasks, for example to query for human tasks waiting for them, and to work on these tasks.

223 A human task has people assigned to it. These assignments define who should be allowed to play a
224 certain role on that task. Human tasks may also specify how task metadata should be rendered on
225 different devices or applications making them portable and interoperable with different types of software.
226 Human tasks can be defined to react on timeouts, triggering an appropriate escalation action.

227 This also holds true for *notifications*. Notifications are a special type of human task that allows the
228 sending of information about noteworthy business events to people. Notifications are always one-way,
229 i.e., they are delivered in a fire-and-forget manner: The sender pushes out notifications to people without
230 waiting for these people to acknowledge their receipt.

231 Let us take a look at an example, an approval task. Such a human task could be involved in a mortgage
232 business process. After the data of the mortgage has been collected, and, if the value exceeds some
233 amount, a manual approval step is required. This can be implemented by invoking an approval service
234 implemented by the approval task. The invocation of the service by the business process creates an
235 instance of the approval task. As a consequence this task pops up on the task list of the approvers. One
236 of the approvers will claim the task, evaluate the mortgage data, and eventually complete the task by
237 either approving or rejecting it. The output message of the task indicates whether the mortgage has been
238 approved or not. All that is transparent to the caller of the task (a business process in this example).

239 The goal of this specification is to enable portability and interoperability:

- 240 • Portability - The ability to take human tasks and notifications created in one vendor's environment
241 and use them in another vendor's environment.
- 242 • Interoperability - The capability for multiple components (task infrastructure, task list clients and
243 applications or processes with human interactions) to interact using well-defined messages and
244 protocols. This enables combining components from different vendors allowing seamless
245 execution.

246 Out of scope of this specification is how human tasks and notifications are deployed or monitored. Usually
247 people assignment is accomplished by performing queries on a people directory which has a certain
248 organizational model. The mechanism determining how an implementation evaluates people
249 assignments, as well as the structure of the data in the people directory is out of scope.

250 **2 Language Design**

251 The language introduces a grammar for describing human tasks and notifications. Both design time
252 aspects, such as task properties and notification properties, and runtime aspects, such as task states and
253 events triggering transitions between states are covered by the language. Finally, it introduces a
254 programming interface which can be used by applications involved in the life cycle of a task to query task
255 properties, execute the task, or complete the task. This interface helps to achieve interoperability between
256 these applications and the task infrastructure when they come from different vendors.

257 The language provides an extension mechanism that can be used to extend the definitions with additional
258 vendor-specific or domain-specific information.

259 Throughout this specification, WSDL and schema elements may be used for illustrative or convenience
260 purposes. However, in a situation where those elements or other text within this document contradict the
261 separate WS-HumanTask, WSDL or schema files, it is those files that have precedence and not this
262 document.

263 **2.1 Dependencies on Other Specifications**

264 WS-HumanTask utilizes the following specifications:

- 265 • WSDL 1.1
- 266 • XML Schema 1.0
- 267 • XPath 1.0
- 268 • WS-Addressing 1.0
- 269 • WS-Coordination 1.1
- 270 • WS-Policy 1.5

271 **2.2 Notational Conventions**

272 The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD
273 NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described
274 in RFC 2119 [RFC 2119].

275 **2.3 Conformance Targets**

276 The following conformance targets are defined as part of this specification

- 277 • WS-HumanTask Definition
278 A WS-HumanTask Definition is any artifact that complies with the human interaction schema and
279 additional constraints defined in this document.
- 280 • WS-HumanTask Processor
281 A WS-HumanTask Processor is any implementation that accepts a WS-HumanTask definition
282 and executes the semantics as defined in this document.
- 283 • WS-HumanTask Parent
284 A WS-HumanTask Parent is any implementation that supports the Interoperable Protocol for
285 Advanced Interactions with Human Tasks as defined in this document.
- 286 • WS-HumanTask Client
287 A WS-HumanTask Client is any implementation that uses the Programming Interfaces of the
288 WS-HumanTask Processor.

289 **2.4 Language Extensibility**

290 The WS-HumanTask extensibility mechanism allows:

- 291 • Attributes from other namespaces to appear on any WS-HumanTask element

- Elements from other namespaces to appear within WS-HumanTask elements
- Extension attributes and extension elements MUST NOT contradict the semantics of any attribute or element from the WS-HumanTask namespace. For example, an extension element could be used to introduce a new task type.
- The specification differentiates between mandatory and optional extensions (the section below explains the syntax used to declare extensions). If a mandatory extension is used, a compliant implementation has to understand the extension. If an optional extension is used, a compliant implementation can ignore the extension.

2.5 Overall Language Structure

Human interactions subsume both human tasks and notifications. While human tasks and notifications are described in subsequent sections, this section explains the overall structure of human interactions definition.

2.5.1 Syntax

```
<htd:humanInteractions
  xmlns:htd="http://docs.oasis-open.org/ns/bpel4people/ws-humantask/200803"
  xmlns:xsd="http://www.w3.org/2001/XMLSchema"
  xmlns:tns="anyURI"
  targetNamespace="anyURI"
  expressionLanguage="anyURI"?
  queryLanguage="anyURI"?>

  <htd:extensions>?
    <htd:extension namespace="anyURI" mustUnderstand="yes|no"/>+
  </htd:extensions>

  <htd:import namespace="anyURI"?
  location="anyURI"?
  importType="anyURI" /*>

  <htd:logicalPeopleGroups>?
    <htd:logicalPeopleGroup name="NCName" reference="QName"?>+
      <htd:parameter name="NCName" type="QName" /*>
    </htd:logicalPeopleGroup>
  </htd:logicalPeopleGroups>

  <htd:tasks>?
    <htd:task name="NCName">+
      ...
    </htd:task>
  </htd:tasks>

  <htd:notifications>?
    <htd:notification name="NCName">+
      ...
    </htd:notification>
  </htd:notifications>

</htd:humanInteractions>
```

2.5.2 Properties

The `<humanInteractions>` element has the following properties:

- 343 • `expressionLanguage`: This attribute specifies the expression language used in the enclosing
344 elements. The default value for this attribute is `urn:ws-ht:sublang:xpath1.0` which
345 represents the usage of XPath 1.0 within human interactions definition. A WS-HumanTask
346 Definition that uses expressions MAY override the default expression language for individual
347 expressions. A WS-HumanTask Processor MUST support the use of XPath 1.0 as the expression
348 language.
- 349 • `queryLanguage`: This attribute specifies the query language used in the enclosing elements. The
350 default value for this attribute is `urn:ws-ht:sublang:xpath1.0` which represents the usage of XPath
351 1.0 within human interactions definition. A WS-HumanTask Definition that use query expressions
352 MAY override the default query language for individual query expressions. A WS-HumanTask
353 Processor MUST support the use of XPath 1.0 as the query language.
- 354 • `extensions`: This element is used to specify namespaces of WS-HumanTask extension attributes
355 and extension elements. The element is optional. If present, it MUST include at least one
356 extension element. The `<extension>` element is used to specify a namespace of WS-HumanTask
357 extension attributes and extension elements, and indicate whether they are mandatory or
358 optional. Attribute `mustUnderstand` is used to specify whether the extension must be understood
359 by a compliant implementation. If the attribute has value "yes" the extension is mandatory.
360 Otherwise, the extension is optional. If a WS-HumanTask Processor does not support one or
361 more of the extensions with `mustUnderstand="yes"`, then the human interactions definition MUST
362 be rejected. A WS-HumanTask Processor MAY ignore optional extensions. A WS-HumanTask
363 Definition MAY declare optional extensions. The same extension URI MAY be declared multiple
364 times in the `<extensions>` element. If an extension URI is identified as mandatory in one
365 `<extension>` element and optional in another, then the mandatory semantics have precedence
366 and MUST be enforced by a WS-HumanTask Processor. The extension declarations in an
367 `<extensions>` element MUST be treated as an unordered set.
- 368 • `import`: This element is used to declare a dependency on external WS-HumanTask and WSDL
369 definitions. Zero or more `<import>` elements MAY appear as children of the
370 `<humanInteractions>` element.
- 371 The `namespace` attribute specifies an absolute URI that identifies the imported definitions. This
372 attribute is optional. An `<import>` element without a namespace attribute indicates that external
373 definitions are in use which are not namespace-qualified. If a namespace is specified then the
374 imported definitions MUST be in that namespace. If no namespace is specified then the imported
375 definitions MUST NOT contain a `targetNamespace` specification. The namespace
376 `http://www.w3.org/2001/XMLSchema` is imported implicitly. Note, however, that there is no
377 implicit XML Namespace prefix defined for `http://www.w3.org/2001/XMLSchema`.
- 378 The `location` attribute contains a URI indicating the location of a document that contains
379 relevant definitions. The `location` URI MAY be a relative URI, following the usual rules for
380 resolution of the URI base [XML Base, RFC 2396]. The `location` attribute is optional. An
381 `<import>` element without a `location` attribute indicates that external definitions are used by
382 the human interactions definition but makes no statement about where those definitions may-can
383 be found. The `location` attribute is a hint and a WS-HumanTask Processor is not required to
384 retrieve the document being imported from the specified location.
- 385 The mandatory `importType` attribute identifies the type of document being imported by
386 providing an absolute URI that identifies the encoding language used in the document. The value
387 of the `importType` attribute MUST be set to `http://docs.oasis-`
388 `open.org/ns/bpel4people/ws-humantask/200803` when importing human interactions
389 definitions, **or** to `http://schemas.xmlsoap.org/wsd1/` when importing WSDL 1.1
390 documents or to <http://www.w3.org/2001/XMLSchema> when importing XML Schema
391 documents.
- 392 According to these rules, it is permissible to have an `<import>` element without `namespace` and
393 `location` attributes, and only containing an `importType` attribute. Such an `<import>` element

394 indicates that external definitions of the indicated type are in use that are not namespace-
395 qualified, and makes no statement about where those definitions may-can be found.

396 A WS-HumanTask Definition MUST import all other WS-HumanTask definitions-and, WSDL
397 definitions, and XML Schema definitions it uses. In order to support the use of definitions from
398 namespaces spanning multiple documents, a WS-HumanTask Definition MAY include more than
399 one import declaration for the same namespace and importType, provided that those
400 declarations include different location values. <import> elements are conceptually unordered. A
401 WS-HumanTask Processor MUST reject the imported documents if they contain conflicting
402 definitions of a component used by the imported WS-HumanTask Definition.

403 Documents (or namespaces) imported by an imported document (or namespace) MUST NOT be
404 transitively imported by a WS-HumanTask Processor. In particular, this means that if an external
405 item is used by a task enclosed in the WS-HumanTask Definition, then a document (or
406 namespace) that defines that item MUST be directly imported by the WS-HumanTask Definition.
407 This requirement does not limit the ability of the imported document itself to import other
408 documents or namespaces.

- 409 • *logicalPeopleGroups*: This element specifies a set of logical people groups. The element is
410 optional. If present, it MUST include at least one *logicalPeopleGroup* element. The set of logical
411 people groups MUST contain only those logical people groups that are used in the
412 *humanInteractions* element, and enclosed human tasks and notifications. The
413 *logicalPeopleGroup* element has the following attributes. The *name* attribute specifies the name
414 of the logical people group. The name MUST be unique among the names of all
415 *logicalPeopleGroups* defined within the *humanInteractions* element. The *reference* attribute is
416 optional. In case a logical people group used in the *humanInteractions* element is defined in an
417 imported WS-HumanTask definition, the reference attribute MUST be used to specify the logical
418 people group. The *parameter* element is used to pass data needed for people query evaluation.
- 419 • *tasks*: This element specifies a set of human tasks. The element is optional. If present, it MUST
420 include at least one <task> element. The syntax and semantics of the <task> element are
421 introduced in section 4 “Human Tasks”.
- 422 • *notifications*: This element specifies a set of notifications. The element is optional. If
423 present, it MUST include at least one <notification> element. The syntax and semantics of the
424 <notification> element are introduced in section 5 “Notifications”.
- 425 • Element *humanInteractions* MUST NOT be empty, that is it MUST include at least one element.

426

427 All elements in WS-HumanTask Definition MAY use the element <documentation> to provide annotation
428 for users. The content could be a plain text, HTML, and so on. The <documentation> element is optional
429 and has the following syntax:

430

```
431 <htd:documentation xml:lang="xsd:language">  
432   ...  
433 </htd:documentation>
```

434

3 Concepts

435

3.1 Generic Human Roles

436 Generic human roles define what a person or a group of people resulting from a people query can do with
437 tasks and notifications. The following generic human roles are taken into account in this specification:

- 438 • Task initiator
- 439 • Task stakeholders
- 440 • Potential owners
- 441 • Actual owner
- 442 • Excluded owners
- 443 • Business administrators
- 444 • Notification recipients

445

446 | A *task initiator* is the person who creates the task instance. ~~A Depending on how the task has been~~
447 ~~instantiated the task initiator may or may not be defined. That is, a~~ WS-HumanTask Definition MAY define
448 assignment for this generic human role. ~~That is, d~~Depending on how the task has been instantiated the
449 task initiator can be defined.

450 The *task stakeholders* are the people ultimately responsible for the oversight and outcome of the task
451 instance. A task stakeholder can influence the progress of a task, for example, by adding ad-hoc
452 attachments, forwarding the task, or simply observing the state changes of the task. It is also allowed to
453 perform administrative actions on the task instance and associated notification(s), such as resolving
454 missed deadlines. A WS-HumanTask Definition MAY define assignment for this generic human role. WS-
455 HumanTask Processors MUST ensure that at least one person is associated with this role at runtime.

456 *Potential owners* of a task are persons who receive the task so that they can claim and complete it. A
457 potential owner becomes the *actual owner* of a task by explicitly claiming it. Before the task has been
458 claimed, potential owners can influence the progress of the task, for example by changing the priority of
459 the task, adding ad-hoc attachments or comments. All excluded owners are implicitly removed from the
460 set of potential owners. A WS-HumanTask Definition MAY define assignment for this generic human role.

461 *Excluded owners* are people who cannot become an actual or potential owner and thus they cannot
462 reserve or start the task. A WS-HumanTask Definition MAY define assignment for this generic human
463 role.

464 An *actual owner* of a task is the person actually performing the task. A task managed by a WS-
465 HumanTask Processor MUST have exactly one actual owner. When task is performed, the actual owner
466 can execute actions, such as revoking the claim, forwarding the task, suspending and resuming the task
467 execution or changing the priority of the task. A WS-HumanTask Definition MUST NOT define assignment
468 for this generic human role.

469 *Business administrators* play the same role as task stakeholders but at task type level. Therefore,
470 business administrators can perform the exact same operations as task stakeholders. Business
471 | administrators may-can also observe the progress of notifications. A WS-HumanTask Definition MAY
472 define assignment for this generic human role. WS-HumanTask Processors MUST ensure that at runtime
473 at least one person is associated with this role.

474 *Notification recipients* are persons who receive the notification, such as happens when a deadline is
475 missed or when a milestone is reached. This role is similar to the roles potential owners and actual owner
476 but has different repercussions because a notification recipient does not have to perform any action and
477 hence it is more of informational nature than participation. A notification has one or more recipients. A
478 WS-HumanTask Definition MAY define assignment for this generic human role.

479 3.2 Assigning People

480 To determine who is responsible for acting on a human task in a certain generic human role or who will
481 receive a notification, people need to be assigned. People assignment can be achieved in different ways:

- 482 • Via logical people groups (see 3.2.1 “Using Logical People Groups”)
- 483 • Via literals (see 3.2.2 “Using Literals”)
- 484 • Via expressions e.g., by retrieving data from the input message of the human task (see 3.2.3
485 “Using Expressions”).

486 When specifying people assignments then the data type

487 `htd:tOrganizationalEntity` is used. Using

488 `htd:tOrganizationalEntity` allows ~~to~~ the assignment of either a
489 set of people or an unresolved group of people (“work queue”).

490 **Syntax:**

```
491 <htd:peopleAssignments>  
492  
493   <htd:genericHumanRole>+  
494     <htd:from>...</htd:from>  
495   </htd:genericHumanRole>  
496  
497 </htd:peopleAssignments>
```

498 The following syntactical elements for generic human roles are introduced. They can be used wherever
499 the abstract element `genericHumanRole` is allowed by the WS-HumanTask XML Schema.

```
500 <htd:potentialOwners>  
501   <htd:from>...</htd:from>  
502 </htd:potentialOwners>  
503  
504 <htd:excludedOwners>  
505   <htd:from>...</htd:from>  
506 </htd:excludedOwners>  
507  
508 <htd:taskInitiator>  
509   <htd:from>...</htd:from>  
510 </htd:taskInitiator>  
511  
512 <htd:taskStakeholders>  
513   <htd:from>...</htd:from>  
514 </htd:taskStakeholders>  
515  
516 <htd:businessAdministrators>  
517   <htd:from>...</htd:from>  
518 </htd:businessAdministrators>  
519  
520 <htd:recipients>  
521   <htd:from>...</htd:from>  
522 </htd:recipients>
```

523 Element `<htd:from>` is used to specify the value to be assigned to a role. The element has different
524 forms as described below.

525 3.2.1 Using Logical People Groups

526 | A *logical people group* represents ~~either~~ one person, a set of people, or one or many unresolved groups
527 of people (i.e., group names). A logical people group is bound to a people query against a people
528 directory at deployment time. Though the term *query* is used, the exact discovery and invocation

529 mechanism of this query is not defined by this specification. There are no limitations as to how the logical
530 people group is evaluated. At runtime, this people query is evaluated to retrieve the actual people
531 assigned to the task or notification. Logical people groups MUST support query parameters which are
532 passed to the people query at runtime. Parameters MAY refer to task instance data (see section 3.4 for
533 more details). During people query execution a ~~task processor infrastructure may~~can decide which of
534 the parameters defined by the logical people group are used. A WS-HumanTask Processor ~~it may~~MAY
535 use zero or more of the parameters specified. It ~~may~~MAY also override certain parameters with values
536 defined during logical people group deployment. The deployment mechanism for tasks and logical people
537 groups is out of scope for this specification.

538 A logical people group has one instance per set of unique arguments. Whenever a logical people group is
539 referenced for the first time with a given set of unique arguments, a new instance MUST be created by
540 the WS-HumanTask Processor. To achieve that, the logical people group MUST be evaluated / resolved
541 for this set of arguments. Whenever a logical people group is referenced for which an instance already
542 exists (i.e., it has already referenced before with the same set of arguments), the logical people group
543 MAY be re-evaluated/re-resolved.

544 In particular, for a logical people group with no parameters, there is a single instance, which MUST be
545 evaluated / resolved when the logical people group is first referenced, and which MAY be re-evaluated /
546 re-resolved when referenced again.

547 People queries are evaluated during the creation of a human task or a notification. If a people query fails
548 a WS-HumanTask Processor MUST create the human task or notification anyway. Failed people queries
549 MUST be treated like people queries that return an empty result set. If the potential owner people query
550 returns an empty set of people a WS-HumanTask Processor MUST perform nomination (see section
551 4.7.1 "Normal processing of a Human Task"). In case of notifications, a WS-HumanTask Processor MUST
552 apply the same to notification recipients.

553 People queries return either one person, a set of people, or the name of one or many groups of people.
554 The latter is added to support "work queue" based business scenarios, where people see work they have
555 been assigned to due to their membership of a certain group. Especially in cases where group
556 membership changes frequently, this "late binding" to the actual group members is beneficial.

557 Logical people groups are global elements enclosed in a human interactions definition document. Multiple
558 human tasks in the same document can utilize the same logical people group definition. During
559 deployment each logical people group is bound to a people query. If two human tasks reference the same
560 logical people group, they are bound to the same people query. However, this does not guarantee that
561 the tasks are actually assigned to the same set of people. The people query is performed for each logical
562 people group reference of a task and ~~may~~can return different results, for example if the content of the
563 people directory has been changed between two queries. Binding of logical people groups to actual
564 people query implementations is out of scope for this specification.

565

566 **Syntax:**

```
567 <htd:from logicalPeopleGroup="NCName">  
568   <htd:argument name="NCName" expressionLanguage="anyURI"? >*<br>  
569   expression<br>  
570   </htd:argument><br>  
571 </htd:from>
```

572

573 The `logicalPeopleGroup` attribute refers to a `logicalPeopleGroup` definition. The element
574 `<argument>` is used to pass values used in the people query. The `expressionLanguage` attribute
575 specifies the language used in the expression. The attribute is optional. If not specified, the default
576 language as inherited from the closest enclosing element that specifies the attribute MUST be used by
577 WS-HumanTask Processor.

578

579 **Example:**

```
580 <htd:potentialOwners>  
581   <htd:from logicalPeopleGroup="regionalClerks">  
582     <htd:argument name="region">  
583       htd:getInput("part1")/region
```

```
584     </htd:argument>
585     </htd:from>
586 </htd:potentialOwners>
```

587 3.2.2 Using Literals

588 People assignments can be defined literally by directly specifying the user identifier(s) or the name(s) of
589 groups using either the `htd:tOrganizationalEntity`/`htt:tOrganizationalEntity` or
590 `htd:tUser`/`htt:tUser` data type introduced below (see 3.2.4 “Data Type for Organizational Entities”).

591 Syntax:

```
592 <htd:from>
593   <htd:literal>
594     ... literal value ...
595   </htd:literal>
596 </htd:from>
```

597

598 Example specifying user identifiers:

```
599 <htd:potentialOwners>
600   <htd:from>
601     <htd:literal>
602       <htd:organizationalEntityhtt:organizationalEntity>
603         <htd:usershtt:users>
604           <htd:userhtt:user>Alan</htd:userhtt:user>
605           <htd:userhtt:user>Dieter</htd:userhtt:user>
606           <htd:userhtt:user>Frank</htd:userhtt:user>
607           <htd:userhtt:user>Gerhard</htd:userhtt:user>
608           <htd:userhtt:user>Ivana</htd:userhtt:user>
609           <htd:userhtt:user>Karsten</htd:userhtt:user>
610           <htd:userhtt:user>Matthias</htd:userhtt:user>
611           <htd:userhtt:user>Patrick</htd:userhtt:user>
612         </htd:usershtt:users>
613       </htd:organizationalEntityhtt:organizationalEntity>
614     </htd:literal>
615   </htd:from>
616 </htd:potentialOwners>
```

617

618 Example specifying group names:

```
619 <htd:potentialOwners>
620   <htd:from>
621     <htd:literal>
622       <htd:organizationalEntityhtt:organizationalEntity>
623         <htd:grouphtt:sgroups>
624           <htd:grouphtt:group>bpel4people_authors</htd:grouphtt:group>
625         </htd:grouphtt:sgroups>
626       </htd:organizationalEntityhtt:organizationalEntity>
627     </htd:literal>
628   </htd:from>
629 </htd:potentialOwners>
```

630 3.2.3 Using Expressions

631 Alternatively people can be assigned using expressions returning either an instance of the
632 `htd:tOrganizationalEntity`/`htt:tOrganizationalEntity` data type or the
633 `htd:tUser`/`htt:tUser` data type introduced below (see 3.2.4 “Data Type for Organizational Entities”).

634

635 Syntax:

```
636 <htd:from expressionLanguage="anyURI"?>
637   expression
638 </htd:from>
```

639
640 The `expressionLanguage` attribute specifies the language used in the expression. The attribute is
641 optional. If not specified, the default language as inherited from the closest enclosing element that
642 specifies the attribute MUST be used by WS-HumanTask Processor.

643

644 **Example:**

```
645 <htd:potentialOwners>
646   <htd:from>htd:getInput("part1")/approvers</htd:from>
647 </htd:potentialOwners>
648
649 <htd:businessAdministrators>
650   <htd:from>
651     htd:except( htd:getInput("part1")/admins,
652               htd:getInput("part1")/globaladmins[0] )
653   </htd:from>
654 </htd:businessAdministrators>
```

655 **3.2.4 Data Type for Organizational Entities**

656 The following XML schema definition describes the format of the data that is returned at runtime when
657 evaluating a logical people group. The result can contain either a list of users or a list of groups. The latter
658 is used to defer the resolution of one or more groups of people to a later point, such as when the user
659 accesses a task list.

```
660 <xsd:element name="organizationalEntity" type="tOrganizationalEntity" />
661 <xsd:complexType name="tOrganizationalEntity">
662   <xsd:choice>
663     <xsd:element ref="users" />
664     <xsd:element ref="groups" />
665   </xsd:choice>
666 </xsd:complexType>
667
668 <xsd:element name="user" type="tUser" />
669 <xsd:simpleType name="tUser">
670   <xsd:restriction base="xsd:string" />
671 </xsd:simpleType>
672
673 <xsd:element name="users" type="tUserlist" />
674 <xsd:complexType name="tUserlist">
675   <xsd:sequence>
676     <xsd:element ref="user" minOccurs="0" maxOccurs="unbounded" />
677   </xsd:sequence>
678 </xsd:complexType>
679
680 <xsd:element name="group" type="tGroup" />
681 <xsd:simpleType name="tGroup">
682   <xsd:restriction base="xsd:string" />
683 </xsd:simpleType>
684
685 <xsd:element name="groups" type="tGrouplist" />
686 <xsd:complexType name="tGrouplist">
687   <xsd:sequence>
688     <xsd:element ref="group" minOccurs="0" maxOccurs="unbounded" />
689   </xsd:sequence>
690 </xsd:complexType>
```

691 3.3 Task Rendering

692 Humans require a presentation interface to interact with a machine. This specification covers the service
693 interfaces that enable this to be accomplished, and enables this in different constellations of software
694 from different parties. The key elements are the task list client, the task engine and the applications
695 invoked when a task is executed.

696 It is assumed that a single task instance can be rendered by different task list clients so the task engine
697 does not depend on a single dedicated task list client. Similarly it is assumed that one task list client can
698 present tasks from several task engines in one homogenous list and can handle the tasks in a consistent
699 manner. The same is assumed for notifications.

700 A distinction is made between the rendering of the meta-information associated with the task or
701 notification (*task-description UI* and *task list UI*) (see section 4.3 for more details on presentation
702 elements) and the rendering of the task or notification itself (*task-UI*) used for task execution (see section
703 4.4 for more details on task rendering). For example, the task-description UI includes the rendering of a
704 summary list of pending or completed tasks and detailed meta-information such as a deadlines, priority
705 and description about how to perform the task. It is the task list client that deals with this.

706 The task-UI can be rendered by the task list client or delegated to a rendering application invoked by the
707 task list client. The task definition and notification definition can define different rendering information for
708 the task-UI using different rendering methodologies.

709 Versatility of deployment determines which software within a particular constellation performs the
710 presentation rendering.

711 The task-UI can be specified by a rendering method within the task definition or notification definition. The
712 rendering method is identified by a unique name attribute and specifies the type of rendering technology
713 being used. A task or a notification can have more than one such rendering method, e.g. one method for
714 each environment the task or notification is accessed from (e.g. workstation, mobile device).

715 The task-list UI encompasses all information crucial for understanding the importance of and details about
716 a given task or notification (e.g. task priority, subject and description) - typically in a table-like layout.
717 Upon selecting a task, i.e. an entry in case of a table-like layout, the user is given the opportunity to
718 launch the corresponding task-UI. The task-UI has access to the task instance data, and can comprise
719 and manipulate documents other than the task instance. It can be specified by a rendering method within
720 the task description.

721 3.4 Task Instance Data

722 Task instance data falls into three categories:

- 723 • Presentation data – The data is derived from the task definition or the notification definition such
724 as the name, subject or description.
- 725 • Context data - A set of dynamic properties, such as priority, task state, time stamps and values
726 for all generic human roles.
- 727 • Operational data – The data includes the input message, output message, attachments and
728 comments.

729 3.4.1 Presentation Data

730 The presentation data is used, for example, when displaying a task or a notification in the task list client.
731 The presentation data has been prepared for display such as by substituting variables. See section 4.3
732 “Presentation Elements” for more details.

733 3.4.2 Context Data

734 The task context includes the following:

- 735 • Task state
- 736 • Priority

- 737 • Values for all generic human roles, i.e. potential owners, actual owner and business
738 administrators
- 739 • Time stamps such as start time, completion time, defer expiration time, and expiration time
- 740 • Skipable indicator

741 A WS-HumanTask Processor MAY extend this set of properties available in the task context. For
742 example, the actual owner ~~may might~~ starts the execution of ~~the a~~ task but ~~does not immediately~~
743 ~~complete it immediately, in which case an~~ ~~the task could be long-running task so~~ An intermediate state
744 could ~~therefore~~ be saved in the task context.

745 3.4.3 Operational Data

746 The operational data of a task consists of its input data and output data or fault data, as well as any ad-
747 hoc attachments and comments. The operational data of a notification is restricted to its input data.
748 Operational data is accessed using the XPath extension functions and programming interface.

749 3.4.3.1 Ad-hoc Attachments

750 A WS-HumanTask Processor MAY allow arbitrary additional data to be attached to a task. This additional
751 data is referred to as *task ad-hoc attachments*. An ad-hoc attachment is specified by its name, its type
752 and its content.

753 The `name` element is used to specify attachment name. Several attachments MAY have the same name
754 and can then be retrieved as a collection.

755 The `contentType` of an attachment can be any valid XML schema type, including `xsd:any`, or any MIME
756 type. The attachment data is assumed to be of that specified content type.

757 The `contentCategory` of an attachment is a URI used to qualify the `contentType`. While `contentType`
758 contains the type of the attachment, the `contentCategory` specifies the type system used when defining
759 the `contentType`. Predefined values for `contentCategory` are

- 760 • "`http://www.w3.org/2001/XMLSchema`"; if XML Schema types are used for the
761 `contentType`
- 762 • "`http://www.iana.org/assignments/media-types/`"; if MIME types are used for the
763 `contentType`

764 The set of values is extensible. A WS-HumanTask Processor MUST support the use of XML Schema
765 types and MIME types as content categories, indicated by the predefined URI values shown above.

766 The `accessType` element indicates if the attachment is specified inline or by reference. In the inline case
767 it MUST contain the string constant "inline". In this case the `value` of the `attachment` data type
768 contains the base64 encoded attachment. In case the attachment is referenced it MUST contain the
769 string "URL", indicating that the `value` of the `attachment` data type contains a URL from where the
770 attachment can be retrieved. Other values of the `accessType` element are allowed for extensibility
771 reasons, for example to enable inclusion of attachment content from content management systems.

772 The `attachedAt` element indicates when the attachment is added.

773 The `attachedBy` element indicates who added the attachment. It could be a user, not a group or a list of
774 users or groups.

775 ~~At~~Task ~~may have ad-hoc attachments.~~ ~~A~~ad-hoc attachments can be added, deleted and retrieved by
776 name. Deletion and retrieving affects all attachments of that name.

777

778 Attachment Info Data Type

779 The following data type is used to return infos attachment information on ad-hoc attachments.

```
780 <xsd:element name="attachmentInfo" type="tAttachmentInfo" />  
781 <xsd:complexType name="tAttachmentInfo">  
782   <xsd:sequence>  
783     <xsd:element name="name" type="xsd:string" />  
784     <xsd:element name="accessType" type="xsd:string" />
```

```

785 <xsd:element name="contentType" type="xsd:string" />
786 <xsd:element name="contentCategory" type="xsd:anyURI" />
787 <xsd:element name="attachedAt" type="xsd:dateTime" />
788 <xsd:element name="attachedBy" type="htd:tUserhtt:tUser" />
789 <xsd:any namespace="##other" processContents="lax"
790     minOccurs="0" maxOccurs="unbounded" />
791 </xsd:sequence>
792 </xsd:complexType>
793

```

794 Attachment Data Type

795 The following data type is used to return ad-hoc attachments.

```

796 <xsd:element name="attachment" type="tAttachment" />
797 <xsd:complexType name="tAttachment">
798   <xsd:sequence>
799     <xsd:element ref="attachmentInfo" />
800     <xsd:element name="value" type="xsd:anyType" />
801   </xsd:sequence>
802 </xsd:complexType>

```

803 3.4.3.2 Comments

804 A WS-HumanTask Processor MAY allow tasks to have associated textual notes added by participants of
805 the task. These notes are collectively referred to as *task comments*. Comments are essentially a
806 chronologically ordered list of notes added by various users who worked on the task. A comment has the
807 text, user information and a timestamp. Comments are usually added individually, but retrieved as one
808 group. Comments usage is optional in a task.

809 The `addedAt` element indicates when the comment is added.

810 The `addedBy` element indicates who added the comment. It could be a user, not a group or a list of users
811 or groups.

813 Comment Data Type

814 The following data type is used to return comments.

```

815 <xsd:element name="comment" type="tComment" />
816 <xsd:complexType name="tComment">
817   <xsd:sequence>
818     <xsd:element name="addedAt" type="xsd:dateTime" />
819     <xsd:element name="addedBy" type="htd:tUserhtt:tUser" />
820     <xsd:element name="text" type="xsd:string" />
821     <xsd:any namespace="##other" processContents="lax"
822         minOccurs="0" maxOccurs="unbounded" />
823   </xsd:sequence>
824 </xsd:complexType>

```

825

826 Comments can be added to a task and retrieved from a task.

827 3.4.4 Data Types for Task Instance Data

828 The following data types are used to represent instance data of a task or a notification. The data type
829 `htt:tTaskAbstract` is used to provide the summary data of a task or a notification that is displayed
830 on a task list. The data type `htt:tTaskhtt:tTaskDetails` contains the data of a task or a notification,
831 except ad-hoc attachments, comments and presentation description. The data that is not contained in
832 `htt:tTaskhtt:tTaskDetails` can be retrieved separately using the task API.

833 Contained presentation elements are in a single language (the context determines that language, e.g.,
834 when a task abstract is returned in response to a simple query, the language from the locale of the
835 requestor is used).

836 The elements `startByExists` and `completeByExists` have a value of “true” if the task has at least
837 one start deadline or at least one completion deadline respectively. The actual times (`startBy` and
838 `completeBy`) of the individual deadlines can be retrieved using the query operation (see section 6.1.3
839 “Advanced Query Operation”).

840 Note that elements that do not apply to notifications are defined as optional.

841

842 TaskAbstract Data Type

```
843 <xsd:element name="taskAbstract" type="tTaskAbstract" />
844 <xsd:complexType name="tTaskAbstract">
845   <xsd:sequence>
846     <xsd:element name="id"
847       type="xsd:string" />
848     <xsd:element name="taskType"
849       type="xsd:string" />
850     <xsd:element name="name"
851       type="xsd:QName" />
852     <xsd:element name="status"
853       type="tStatus" />
854     <xsd:element name="priority"
855       type="tPriority" minOccurs="0" />
856     <xsd:element name="createdOn"
857       type="xsd:dateTime" />
858     <xsd:element name="activationTime"
859       type="xsd:dateTime" minOccurs="0" />

1006

4 Human Tasks

1007

The <task> element is used to specify human tasks. The section below introduces the syntax for the element, and individual properties are explained in subsequent sections.

1008

1009

4.1 Overall Syntax

1010

Definition of human tasks:

1011

```
<htd:task name="NCName">
```

1012

```
  <htd:interface portType="QName" operation="NCName"
    responsePortType="QName"? responseOperation="NCName"? />
```

1013

1014

1015

1016

```
  <htd:priority expressionLanguage="anyURI"? >?
    integer-expression
```

1017

1018

```
  </htd:priority>
```

1019

1020

```
  <htd:peopleAssignments>...</htd:peopleAssignments>
```

1021

1022

```
  <htd:delegation
    potentialDelegates="anybody|nobody|potentialOwners|other" />?
```

1023

1024

1025

1026

```
    <htd:from>?
```

1027

```
      ...
```

1028

```
    </htd:from>
```

1029

```
  </htd:delegation>
```

1030

```
  <htd:presentationElements>...</htd:presentationElements>
```

1031

1032

1033

```
  <htd:outcome part="NCName" queryLanguage="anyURI"?>
```

1034

```
    queryContent
```

1035

```
  </htd:outcome>
```

1036

1037

```
  <htd:searchBy expressionLanguage="anyURI"? >?
```

1038

```
    expression
```

1039

```
  </htd:searchBy>
```

1040

```
  <htd:renderings>?
```

1041

```
    <htd:rendering type="QName">+
```

1042

```
      ...
```

1043

```
    </htd:rendering>
```

1044

```
  </htd:renderings>
```

1045

```
  <htd:deadlines>?
```

1046

```
    <htd:startDeadline>*
```

1047

```
      ...
```

1048

```
    </htd:startDeadline>
```

1049

```
    <htd:completionDeadline>*
```

1050

```
      ...
```

1051

```
    </htd:completionDeadline>
```

1052

```
  </htd:deadlines>
```

1053

```
</htd:task>
```

1054

1055

1056

1057

1058 4.2 Properties

1059 The following attributes and elements are defined for tasks:

- 1060 • `name`: This attribute is used to specify the name of the task. The name combined with the target
1061 namespace MUST uniquely identify a task element enclosed in the task definition. This attribute
1062 is mandatory. It is not used for task rendering.
- 1063 • `interface`: This element is used to specify the operation used to invoke the task. The operation
1064 is specified using WSDL, that is, a WSDL port type and WSDL operation are defined. The
1065 element and its `portType` and `operation` attributes are mandatory. The interface is specified
1066 in one of the following forms:

1067 The WSDL operation is a **one-way** operation and the task asynchronously returns output data. In this
1068 case, a WS-HumanTask Definition MUST specify a callback one-way operation, using the
1069 `responsePortType` and `responseOperation` attributes. This callback operation is invoked when the
1070 task has finished. The Web service endpoint address of the callback operation is provided at runtime
1071 when the task's one-way operation is invoked (for details, see section 8 “

1072

1073 Providing Callback Information for Human Tasks

1074

- 1075 • Providing Callback Information for Human Tasks”).
- 1076 • The WSDL operation is a **request-response** operation. In this case, the
1077 `responsePortType` and `responseOperation` attributes MUST NOT be
1078 specified.
- 1079 • `priority`: This element is used to specify the priority of the task. It is an optional element which
1080 value is an integer expression. If present, the WS-HumanTask Definition MUST specify a value
1081 between 0 and 10, where 0 is the highest priority and 10 is the lowest. If not present, the priority
1082 of the task is considered as 5. The result of the expression evaluation is of type
1083 `htt:tPriority`. The `expressionLanguage` attribute specifies the language used in the
1084 expression. The attribute is optional. If not specified, the default language as inherited from the
1085 closest enclosing element that specifies the attribute is used.
- 1086 • `peopleAssignments`: This element is used to specify people assigned to different generic
1087 human roles, i.e. potential owners, and business administrator. The element is mandatory. See
1088 section 3.2 for more details on people assignments.
- 1089 • `delegation`: This element is used to specify constraints concerning delegation of the task.
1090 Attribute `potentialDelegates` defines to whom the task can be delegated. One of the
1091 following values MUST be specified:
 - 1092 • `anybody`: It is allowed to delegate the task to anybody
 - 1093 • `potentialOwners`: It is allowed to delegate the task to potential owners
1094 previously selected
 - 1095 • `other`: It is allowed to delegate the task to other people, e.g. authorized owners.
1096 The element `<from>` is used to determine the people to whom the task can be
1097 delegated.
 - 1098 • `nobody`: It is not allowed to delegate the task.

1099 The delegation element is optional. If this element is not present the task is allowed to be
1100 delegated to anybody.

- 1101 • `presentationElements`: This element is used to specify different information used to display
1102 the task in a task list, such as name, subject and description. See section 4.3 for more details on
1103 presentation elements. The element is mandatory.
- 1104 • `outcome`: This optional element identifies the field (of an xsd simple type) in the output message
1105 which reflects the business result of the task. A conversion takes place to yield an outcome of

- 1106 type `xsd:string`. The optional attribute `queryLanguage` specifies the language used for
 1107 selection. If not specified, the default language as inherited from the closest enclosing element
 1108 that specifies the attribute is used.
- 1109 • `searchBy`: This optional element is used to search for task instances based on a custom search
 1110 criterion. The result of the expression evaluation is of type `xsd:string`. The
 1111 `expressionLanguage` attribute specifies the language used in the expression. The attribute is
 1112 optional. If not specified, the default language as inherited from the closest enclosing element that
 1113 specifies the attribute is used.
 - 1114 • `rendering`: This element is used to specify the rendering method. It is optional. If not present,
 1115 task rendering is implementation dependent. See section 4.4 for more details on rendering tasks.
 - 1116 • `deadlines`: This element specifies different deadlines. It is optional. See section 4.6 for more
 1117 details on timeouts and escalations.

1118 4.3 Presentation Elements

1119 Information about human tasks or notifications needs to be made available in a human-readable way to
 1120 allow users dealing with their tasks and notifications via a user interface, which could be based on various
 1121 technologies, such as Web browsers, Java clients, Flex-based clients or .NET clients. For example, a
 1122 user queries for her tasks, getting a list of tasks she ~~should~~ could work on, displaying a short description
 1123 of each task. Upon selection of one of the tasks, more complete information about the task is displayed
 1124 by the user interface.

1125 Alternatively, a task or notification could be sent directly to a user's inbox, in which case the same
 1126 information would be used to provide a human readable rendering there.

1127 The same human readable information could also be used in reports on all the human tasks executed by
 1128 a particular human task management system.

1129 Human readable information can be specified in multiple languages.

1130

1131 Syntax:

```

1132 <htd:presentationElements>
1133
1134   <htd:name xml:lang="xsd:language"? >*>
1135     Text
1136   </htd:name>
1137
1138   <!-- For the subject and description only,
1139         replacement variables can be used. -->
1140   <htd:presentationParameters expressionLanguage="anyURI"? >?>
1141     <htd:presentationParameter name="NCName" type="QName">+
1142       expression
1143     </htd:presentationParameter>
1144   </htd:presentationParameters>
1145
1146   <htd:subject xml:lang="xsd:language"? >*>
1147     Text
1148   </htd:subject>
1149
1150   <htd:description xml:lang="xsd:language"?
1151                     contentType="mimeTypeString"? >*>
1152     <xsd:any minOccurs="0" maxOccurs="unbounded" />
1153   </htd:description>
1154
1155 </htd:presentationElements>
  
```

1156

1157 Properties

1158 The following attributes and elements are defined for the `htd:presentationElements` element.

- 1159 • `name`: This element is the short title of a task. It uses `xml:lang`, a standard XML attribute, to
1160 define the language of the enclosed information. This attribute uses tags according to RFC 1766
1161 (see [RFC1766]). There could be zero or more `name` elements. A WS-HumanTask Definition
1162 MUST NOT specify multiple `name` elements having the same value for attribute `xml:lang`.
- 1163 • `presentationParameters`: This element specifies parameters used in presentation elements
1164 `subject` and `description`. Attribute `expressionLanguage` identifies the expression
1165 language used to define parameters. This attribute is optional. If not specified, the default
1166 language as inherited from the closest enclosing element that specifies the attribute is used.
1167 Element `presentationParameters` is optional and if present then the WS-HumanTask
1168 Definition MUST specify at least one element `presentationParameter`. Element
1169 `presentationParameter` has attribute `name`, which uniquely identifies the parameter
1170 definition within the `presentationParameters` element, and attribute `type` which defines its
1171 type. A WS-HumanTask Definition MUST specify parameters of XSD simple types. When a
1172 `presentationParameter` is used within `subject` and `description`, the syntax is
1173 `{${parameterName}}`. The pair `"{"` represents the character `"{"` and the pair `"}"` represents
1174 the character `"}"`. Only the defined presentation parameters are allowed, that is, a WS-
1175 HumanTask Definition MUST NOT specify arbitrary expressions embedded in this syntax.
- 1176 • `subject`: This element is a longer text that describes the task. It uses `xml:lang` to define the
1177 language of the enclosed information. There could be zero or more `subject` elements. A WS-
1178 HumanTask Definition MUST NOT specify multiple `subject` elements having the same value for
1179 attribute `xml:lang`.
- 1180 • `description`: This element is a long description of the task. It uses `xml:lang` to define the
1181 language of the enclosed information. The optional attribute `contentType` uses content types
1182 according to RFC 2046 (see [RFC 2046]). The default value for this attribute is `"text/plain"`. A WS-
1183 HumanTask Processor MUST support the content type `"text/plain"`. The WS-HumanTask
1184 Processor SHOULD support HTML (such as `"text/html"` or `"application/xml+xhtml"`). There could
1185 be zero or more `description` elements. As descriptions can exist with different content types, it
1186 is allowed to specify multiple `description` elements having the same value for attribute
1187 `xml:lang`, but the WS-HumanTask Definition MUST specify different content types.

1188

1189 Example:

```
1190 <htd:presentationElements>
1191
1192   <htd:name xml:lang="en-US">Approve Claim</htd:name>
1193   <htd:name xml:lang="de-DE">
1194     Genehmigung der Schadensforderung
1195   </htd:name>
1196
1197   <htd:presentationParameters>
1198     <htd:presentationParameter name="firstname" type="xsd:string">
1199       htd:getInput ("ClaimApprovalRequest")/cust/firstname
1200     </htd:presentationParameter>
1201     <htd:presentationParameter name="lastname" type="xsd:string">
1202       htd:getInput ("ClaimApprovalRequest")/cust/lastname
1203     </htd:presentationParameter>
1204     <htd:presentationParameter name="euroAmount" type="xsd:double">
1205       htd:getInput ("ClaimApprovalRequest")/amount
1206     </htd:presentationParameter>
1207   </htd:presentationParameters>
1208
1209   <htd:subject xml:lang="en-US">
1210     Approve the insurance claim for €{euroAmount} on behalf of
```

```

1211     {$firstname} {$lastname}
1212 </htd:subject>
1213 <htd:subject xml:lang="de-DE">
1214     Genehmigung der Schadensforderung über €{$euroAmount} für
1215     {$firstname} {$lastname}
1216 </htd:subject>
1217
1218 <htd:description xml:lang="en-US" contentType="text/plain">

1230     4711.0815/7 ...
1231 </htd:description>
1232 <htd:description xml:lang="de-DE" contentType="text/html">
1233 <p>
1234     Genehmigen Sie diese Schadensforderung entsprechend Richtlinie
1235     <b>Nr. 4711.0815/7</b>
1236     ...
1237 </p>
1238 </htd:description>
1239
1240 </htd:presentationElements>
1241
1242

```

4.4 Elements for Rendering Tasks

Human tasks and notifications need to be rendered on user interfaces like forms clients, portlets, e-mail clients, etc. The rendering element provides an extensible mechanism for specifying UI renderings for human tasks and notifications (task-UI). The element is optional. One or more rendering methods can be provided in a task definition or a notification definition. A task or notification can be deployed on any WS-HumanTask Processor, irrespective of the fact whether the implementation supports specified rendering methods or not. The rendering method is identified using a QName.

Unlike for presentation elements, language considerations are opaque for the rendering element because the rendering applications typically provide multi-language support. Where this is not the case, providers of certain rendering types can decide to extend the rendering method in order to provide language information for a given rendering.

The content of the rendering element is not defined by this specification. For example, when used in the rendering element, XPath extension functions as defined in section 6.2 MAY be evaluated by a WS-HumanTask Processor.

Syntax:

```

1258 <htd:renderings>
1259   <htd:rendering type="QName">+
1260     <xsd:any minOccurs="1" maxOccurs="1" />
1261   </htd:rendering>
1262 </htd:renderings>

```

1263 4.5 Elements for People Assignment

1264 | The <peopleAssignments> element is used to assign people to ~~the a~~ task. For each generic human
1265 | role, a people assignment element can be specified. A WS-HumanTask Definition MUST specify a people
1266 | assignment for potential owners of a human task. An empty <potentialOwners> element is used to
1267 | specify that if no potential owner is ~~should be~~ assigned by the human task's definition, but another
1268 | means ~~are is~~ used, e.g. ~~because nomination is used, then this is accomplished by adding an empty~~
1269 | <potentialOwners> ~~element~~. Specifying people assignments for task stakeholders, task initiators,
1270 | excluded owners and business administrators is optional. Human tasks never specify recipients. A WS-
1271 | HumanTask Definition MUST NOT specify people assignments for actual owners.

1272

1273 Syntax:

```
1274 <htd:peopleAssignments>  
1275   <htd:potentialOwners>  
1276     ...  
1277   </htd:potentialOwners>  
1278  
1279   <htd:excludedOwners>?  
1280     ...  
1281   </htd:excludedOwners>  
1282  
1283   <htd:taskInitiator>?  
1284     ...  
1285   </htd:taskInitiator>  
1286  
1287   <htd:taskStakeholders>?  
1288     ...  
1289   </htd:taskStakeholders>  
1290  
1291   <htd:businessAdministrators>?  
1292     ...  
1293   </htd:businessAdministrators>  
1294  
1295 </htd:peopleAssignments>
```

1297

1298 | People assignments can result in a set of values or an empty set. In case people assignment results in an
1299 | empty set then the task potentially requires administrative attention. This is out of scope of the
1300 | specification, except for people assignments for potential owners (see section 4.7.1 "Normal processing
1301 | of a Human Task" for more details).

1302

1303 Example:

```
1304 <htd:peopleAssignments>  
1305   <htd:potentialOwners>  
1306     <htd:from logicalPeopleGroup="regionalClerks">  
1307       <htd:argument name="region">  
1308         htd:getInput ("ClaimApprovalRequest") /region  
1309       </htd:argument>  
1310     </htd:from>  
1311   </htd:potentialOwners>  
1312  
1313   <htd:businessAdministrators>  
1314     <htd:from logicalPeopleGroup="regionalManager">  
1315       <htd:argument name="region">  
1316         htd:getInput ("ClaimApprovalRequest") /region  
1317       </htd:argument>  
1318     </htd:from>
```

```
1319 </htd:businessAdministrators>
1320 </htd:peopleAssignments>
```

1321 4.6 Elements for Handling Timeouts and Escalations

1322 Timeouts and escalations allow the specification of a date or time before which the task has to reach a
1323 specific state. If the timeout occurs a set of actions is performed as the response. The state of the task is
1324 not changed. Several deadlines are specified which differ in the point when the timer clock starts and the
1325 state which has to be reached with the given duration or by the given date. They are:

- 1326 • Start deadline: Specifies the time until the task has to start, i.e. it has to reach state *InProgress*. It
1327 is defined as either the period of time or the point in time until the task has to reach state
1328 *InProgress*. Since expressions are allowed, durations and deadlines can be calculated
1329 at runtime, which for example enables custom calendar integration. The time starts to be
1330 measured from the time at which the task enters the state *Created*. If the task does not reach
1331 state *InProgress* by the deadline an escalation action or a set of escalation actions is performed.
1332 Once the task is started, the timer becomes obsolete.
- 1333 • Completion deadline: Specifies the due time of the task. It is defined as either the period of time
1334 until the task gets due or the point in time when the task gets due. The time starts to be measured
1335 from the time at which the task enters the state *Created*. If the task does not reach one of the final
1336 states (*Completed*, *Failed*, *Error*, *Exited*, *Obsolete*) by the deadline an escalation action or a set
1337 of escalation actions is performed.

1338 The element `<deadlines>` is used to include the definition of all deadlines within the task definition. It is
1339 optional. If present then the WS-HumanTask Definition MUST specify at least one deadline.

1340

1341 Syntax:

```
1342 <htd:deadlines>
1343   <htd:startDeadline>*
1344     <htd:documentation xml:lang="xsd:language"? >*
1345       Text
1346     </htd:documentation>
1347     ( <htd:for expressionLanguage="anyURI"? >
1348       duration-expression
1349     </htd:for>
1350     | <htd:until expressionLanguage="anyURI"? >
1351       deadline-expression
1352     </htd:until>
1353     )
1354     <htd:escalation name="NCName">*
1355       ...
1356     </htd:escalation>
1357   </htd:startDeadline>
1358   <htd:completionDeadline>*
1359     ...
1360   </htd:completionDeadline>
1361 </htd:deadlines>
```

1369

1370 The language used in expressions is specified using the `expressionLanguage` attribute. This attribute
1371 is optional. If not specified, the default language as inherited from the closest enclosing element that
1372 specifies the attribute is used.

1373 For all deadlines if a status is not reached within a certain time then an escalation action, specified using
1374 element `<escalation>`, can be triggered. The `<escalation>` element is defined in the section below.
1375 When the task reaches a final state (*Completed, Failed, Error, Exited, Obsolete*) all deadlines are deleted.
1376 Escalations are triggered if

- 1377 1. The associated point in time is reached, or duration has elapsed, and
- 1378 2. The associated condition (if any) evaluates to true

1379 Escalations use notifications to inform people about the status of the task. Optionally, a task might be
1380 reassigned to some other person or group as part of the escalation. Notifications are explained in more
1381 detail in section 5 “Notifications”. For an escalation, a WS-HumanTask Definition MUST specify exactly
1382 one escalation action.

1383 When defining escalations, a notification can be either referred to, or defined inline.

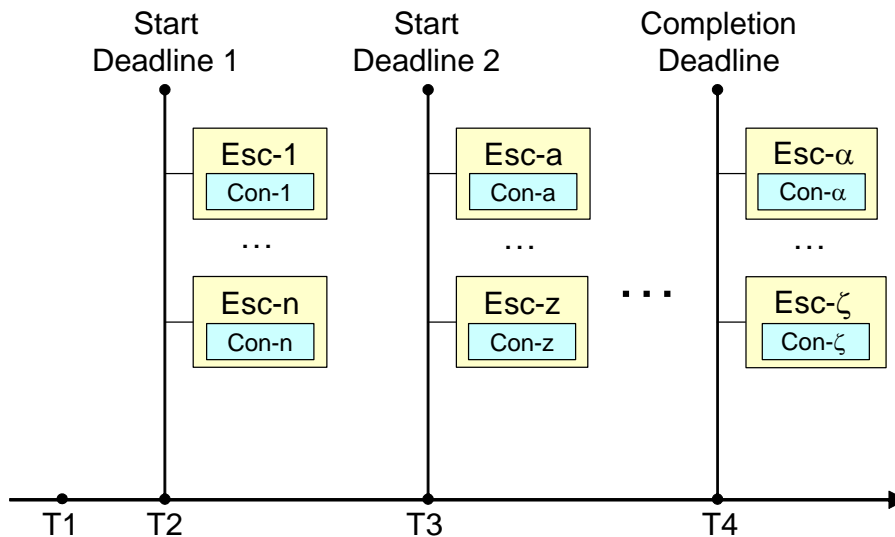

- 1384 • A notification defined in the `<humanInteractions>` root element or imported from a different
1385 namespace can be referenced by specifying its QName in the `reference` attribute of a
1386 `<localNotification>` element. When referring to a notification, the priority and the people
1387 assignments of the original notification definition MAY be overridden using the elements
1388 `<priority>` and `<peopleAssignments>` contained in the `<localNotification>` element.
- 1389 • [AA](#)n inlined notification is defined by a `<notification>` element.

1390 Notifications used in escalations can use the same type of input data as the surrounding task, or different
1391 type of data. If the same type of data is used then the input message of the task is passed to the
1392 notification implicitly. If not, then the `<toPart>` elements are used to assign appropriate data to the
1393 notification, i.e. to explicitly create a multi-part WSDL message from the data. The `part` attribute refers to
1394 a part of the WSDL message. The `expressionLanguage` attribute specifies the language used in the
1395 expression. The attribute is optional. If not specified, the default language as inherited from the closest
1396 enclosing element that specifies the attribute is used.

1397 A WS-HumanTask Definition MUST specify a `<toPart>` element for every part in the WSDL message
1398 definition because parts not explicitly represented by `<toPart>` elements would result in uninitialized parts
1399 in the target WSDL message. The order in which parts are specified is not relevant. If multiple `<toPart>`
1400 elements are present, a WS-HumanTask Processor MUST execute them in an “all or nothing” manner. If
1401 any of the `<toPart>`s fails, the escalation action will not be performed and the execution of the task is not
1402 affected.

1403 Reassignments are used to replace the potential owners of a task when an escalation is triggered. The
1404 `<reassignment>` element is used to specify reassignment. If present then a WS-HumanTask Definition
1405 MUST specify potential owners.

1406 In the case where several reassignment escalations are triggered, the first reassignment (lexical order)
1407 MUST be considered for execution by the WS-HumanTask Processor. The task is set to state *Ready* after
1408 reassignment. Reassignments and notifications are performed in the lexical order.

1409

1410 A task MAY have multiple start deadlines and completion deadlines associated with it. Each such
 1411 deadline encompasses escalation actions each of which MAY send notifications to certain people. The
 1412 corresponding set of people MAY overlap.

1413 As an example, the figure depicts a task that has been created at time T1. Its two start deadlines would
 1414 be missed at time T2 and T3, respectively. The associated escalations whose conditions evaluate to
 1415 "true" are triggered. Both, the escalations Esc-1 to Esc-n as well as escalations Esc-a to Esc-z can
 1416 involve an overlapping set of people. The completion deadline would be missed at time T4.

1417

1418 **Syntax:**

1419

```

1420 <htd:deadlines>
1421   <htd:startDeadline>*
1422   ...
1423
1424   <htd:escalation name="NCName">*
1425
1426     <htd:condition expressionLanguage="anyURI"?>?
1427       boolean-expression
1428     </htd:condition>
1429
1430     <htd:toParts>?
1431       <htd:toPart part="NCName"
1432         expressionLanguage="anyURI"?>+
1433         expression
1434       </htd:toPart>
1435     </htd:toParts>
1436
1437     <!-- notification specified by reference -->
1438     <htd:localNotification reference="QName"?
1439       <htd:priority expressionLanguage="anyURI"?>?
1440       integer-expression
1441     </htd:priority>
1442     <htd:peopleAssignments>?
1443       <htd:recipients>
1444         ...
1445       </htd:recipients>
1446     </htd:peopleAssignments>
  
```

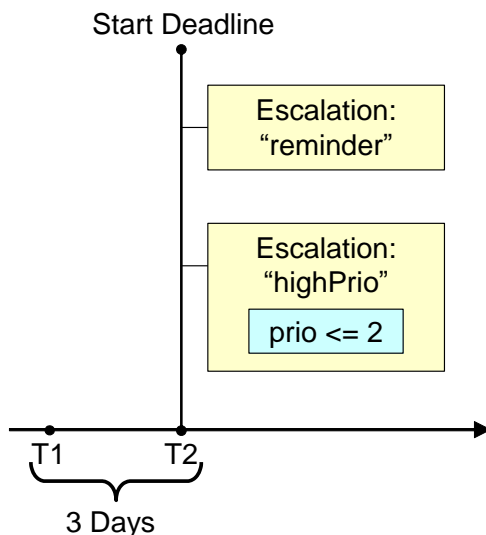

```

1447
1448     </htd:localNotification>
1449
1450     <!-- notification specified inline -->
1451     <htd:notification name="NCName">?
1452         ...
1453     </htd:notification>
1454
1455     <htd:reassignment>?
1456         <htd:potentialOwners>
1457             ...
1458         </htd:potentialOwners>
1459
1460     </htd:reassignment>
1461
1462 </htd:escalation>
1463 </htd:startDeadline>
1464
1465 <htd:completionDeadline>*
1466     ...
1467 </htd:completionDeadline>
1468
1469 </htd:deadlines>
1470
1471

```

1472
1473 **Example:**

1474 The following example shows the specification of a start deadline with escalations. At runtime, the
1475 following picture depicts the result of what is specified in the example:

1476 The human task is created at T1. If it has not been started, i.e., no person is working on it until T2, then
1477 the escalation "reminder" is triggered that notifies the potential owners of the task that work is waiting for
1478 them. In case the task has high priority then at the same time the regional manager is informed. If the
1479 task amount is greater than or equal 10000 the task is reassigned to Alan.

1480 In case that task has been started before T2 was reached, then the start deadline is deactivated, no
1481 escalation occurs.

```

1482
1483 <htd:startDeadline>
1484 <htd:documentation xml:lang="en-US">

```

```
1485 If not started within 3 days, - escalation notifications are sent
1486 if the claimed amount is less than 10000 - to the task's potential
1487 owners to remind them or their todo - to the regional manager, if
1488 this approval is of high priority (0,1, or 2) - the task is
1489 reassigned to Alan if the claimed amount is greater than or equal
1490 10000
1491 </htd:documentation>
1492 <htd:for>P3D</htd:for>
1493
1494 <htd:escalation name="reminder">
1495
1496   <htd:condition>
1497     <![CDATA[
1498       htd:getInput("ClaimApprovalRequest")/amount < 10000
1499       ]]>
1500   </htd:condition>
1501
1502   <htd:toParts>
1503     <htd:toPart name="firstname">

1600 4.7 Human Task Behavior and State Transitions

1601 Human tasks can have a number of different states and substates. The state diagram for human tasks
1602 below shows the different states and the transitions between them.

1603 |

1604 **4.7.1 Normal processing of a Human Task**

1605 Upon creation, a task goes into its initial state *Created*. Task creation starts with the initialization of its
 1606 properties in the following order:

- 1607 1. Input message

- 1608 2. Priority
- 1609 3. Generic human roles (such as excluded owners, potential owners and business administrators)
- 1610 are made available in the lexical order of their definition in the people assignment definition with
- 1611 the constraint that excluded owners are taken into account when evaluating the potential owners.
- 1612 4. All other properties are evaluated after these properties in an implementation dependent order.
- 1613 Task creation succeeds irrespective of whether the people assignment returns a set of values or an
- 1614 empty set. People queries that cannot be executed successfully are treated as if they were returning an
- 1615 empty set.
- 1616 If potential owners were not assigned automatically during task creation then they **MUST** be assigned
- 1617 explicitly using nomination, which is performed by the task's business administrator. The result of
- 1618 evaluating potential owners removes the excluded owners from results. The task remains in the state
- 1619 *Created* until it is activated (i.e., an activation timer has been specified) and has potential owners.
- 1620 When the task has a single potential owner, it transitions into the *Reserved* state, indicating that it is
- 1621 assigned to a single actual owner. Otherwise (i.e., when it has multiple potential owners or is assigned to
- 1622 a work queue), it transitions into the *Ready* state, indicating that it can be claimed by one of its potential
- 1623 owners. Once a potential owner claims the task, it transitions into the *Reserved* state, making that
- 1624 potential owner the actual owner.
- 1625 Once work is started on a task that is in state *Ready* or *Reserved*, it goes into the *InProgress* state,
- 1626 indicating that it is being worked on – if the transition is from *Ready*, the user starting the work becomes
- 1627 its actual owner.
- 1628 On successful completion of the work, the task transitions into the *Completed* final state. On unsuccessful
- 1629 completion of the work (i.e., with an exception), the task transitions into the *Failed* final state.

1630 **4.7.2 Releasing a Human Task**

- 1631 The current actual owner of a human task can *release* a task to again make it available for all potential
- 1632 owners. A task can be released from active states that have an actual owner (*Reserved*, *InProgress*),
- 1633 transitioning it into the *Ready* state. Business data associated with the task (intermediate result data, ad-
- 1634 hoc attachments and comments) is kept.
- 1635 A task that is currently *InProgress* can be stopped by the actual owner, transitioning it into state
- 1636 *Reserved*. Business data associated with the task as well as its actual owner is kept.

1637 **4.7.3 Delegating or forwarding a Human Task**

- 1638 Task's potential owners, actual owner or business administrator can *delegate* a task to another user,
- 1639 making that user the actual owner of the task, and also adding her to the list of potential owners in case
- 1640 she is not, yet. A task can be delegated when it is in an active state (*Ready*, *Reserved*, *InProgress*), and
- 1641 transitions the task into the *Reserved* state. Business data associated with the task is kept.
- 1642 Similarly, task's potential owners, actual owner or business administrator can forward an active task to
- 1643 another person or a set of people, replacing himself by those people in the list of potential owners.
- 1644 Potential owners can only forward tasks that are in the *Ready* state. Forwarding is possible if the task has
- 1645 a set of individually assigned potential owners, not if its potential owners are assigned using one or many
- 1646 groups. If the task is in the *Reserved* or *InProgress* state then the task is implicitly released first, that is,
- 1647 the task is transitioned into the *Ready* state. Business data associated with the task is kept. The user
- 1648 performing the forward is removed from the set of potential owners of the task, and the forwarder is
- 1649 added to the set of potential owners.

1650 **4.7.4 Suspending and resuming a Human Task**

- 1651 In any of its active states (*Ready*, *Reserved*, *InProgress*), a task can be suspended, transitioning it into
- 1652 the *Suspended* state. The *Suspended* state has sub-states to indicate the original state of the task.
- 1653 On resumption of the task, it transitions back to the original state from which it had been suspended.

1654 **4.7.5 Skipping a Human Task**

1655 A person working on a human task or a business administrator can decide that a task is no longer
1656 needed, and hence skip this task. This transitions the task into the *Obsolete* state. This is considered a
1657 “good” outcome of a task, even though an empty result is returned. The enclosing environment can be
1658 notified of that transition as described in section 5.3.

1659 The task can only be skipped if this capability is specified during the task invocation. A side-effect of this
1660 is that a task which is invoked using basic Web service protocols is not skipable.

1661 **4.7.6 Termination of a Human Task**

1662 The enclosing environment of a human task (such as the calling application or business process) can
1663 decide that a task is no longer needed and terminate it, either because a timeout has reached in that
1664 enclosing context (i.e., the task has expired), or because the enclosing environment itself is terminated.
1665 These events transition the task into the *Obsolete* state.

1666 **4.7.7 Error handling for Human Task**

1667 If a human task encounters a non-recoverable error in any of its state (for example, it executes a divide
1668 by zero in an XPath expression), it transitions into the *Error* state. This is considered a “bad” outcome of
1669 the task and no result is returned. The enclosing environment can be notified of that transition as
1670 described in section 5.3.

5 Notifications

1671

1672 Notifications are used to notify a person or a group of people of a noteworthy business event, such as
1673 that a particular order has been approved, or a particular product is about to be shipped. They are also
1674 used in escalation actions to notify a user that a task is overdue or a task has not been started yet. The
1675 person or people to whom the notification will be assigned to could be provided, for example, as result of
1676 a people query to organizational model.

1677 Notifications are simple human interactions that do not block the progress of the caller, that is, the caller
1678 does not wait for the notification to be completed. Moreover, the caller cannot influence the execution of
1679 notifications, e.g. notifications are not terminated if the caller terminates. The caller, i.e. an application, a
1680 business process or an escalation action, initiates a notification passing the required notification data. The
1681 notification appears on the task list of all notification recipients. After a notification recipient removes it,
1682 the notification disappears from the recipient's task list.

1683 A notification MAY have multiple recipients and optionally one or many business administrators. The
1684 generic human roles task initiator, task stakeholders, potential owners, actual owner and excluded
1685 owners play no role.

1686 Presentation elements and task rendering, as described in sections 4.3 and 4.4 respectively, are used for
1687 notifications also. In most cases the subject line and description are sufficient information for the
1688 recipients, especially if the notifications are received in an e-mail client or mobile device. But in some
1689 cases the notifications can be received in a proprietary client so the notification can support a proprietary
1690 rendering format to enable this to be utilized to the full, such as for rendering data associated with the
1691 caller invoking the notification. For example, the description could include a link to the process audit trail
1692 or a button to navigate to business transactions involved in the underlying process.

1693 Notifications do not have ad-hoc attachments, comments or deadlines.

5.1 Overall Syntax

1694

1695 Definition of notifications

1696

```
<htd:notification name="NCName">  
  <htd:interface portType="QName" operation="NCName"/>  
  <htd:priority expressionLanguage="anyURI"?>  
    integer-expression  
  </htd:priority>  
  <htd:peopleAssignments>  
    <htd:recipients>  
      ...  
    </htd:recipients>  
    <htd:businessAdministrators?>  
      ...  
    </htd:businessAdministrators>  
  </htd:peopleAssignments>  
  <htd:presentationElements>  
    ...  
  </htd:presentationElements>  
  <htd:renderings?>  
    ...  
  </htd:renderings>
```

1725 5.2 Properties

1726 The following attributes and elements are defined for notifications:

- 1727 • `name`: This attribute is used to specify the name of the notification. The name combined with the
1728 target namespace MUST uniquely identify a notification in the notification definition. The attribute
1729 is mandatory. It is not used for notification rendering.
- 1730 • `interface`: This element is used to specify the operation used to invoke the notification. The
1731 operation is specified using WSDL, that is a WSDL port type and WSDL operation are defined.
1732 The element and its `portType` and `operation` attributes are mandatory. In the `operation`
1733 attribute, a WS-HumanTask Definition MUST reference a one-way WSDL operation.
- 1734 • `priority`: This element is used to specify the priority of the notification. It is an optional
1735 element which value is an integer expression. If present then the WS-HumanTask Definition
1736 MUST specify a value between 0 and 10, where 0 is the highest priority and 10 is the lowest. If
1737 not present, the priority of the notification is considered as 5. The result of the expression
1738 evaluation is of type `http:tPriority`. The `expressionLanguage` attribute specifies the
1739 language used in the expression. The attribute is optional. If not specified, the default language
1740 as inherited from the closest enclosing element that specifies the attribute is used.
- 1741 • `peopleAssignments`: This element is used to specify people assigned to the notification. The
1742 element is mandatory. A WS-HumanTask Definition MUST include a people assignment for
1743 recipients and MAY include a people assignment for business administrators.
- 1744 • `presentationElements`: The element is used to specify different information used to display
1745 the notification, such as name, subject and description, in a task list. The element is mandatory.
1746 See section 4.3 for more information on presentation elements.
- 1747 • `rendering`: The element is used to specify rendering method. It is optional. If not present,
1748 notification rendering is implementation dependent. See section 4.4 for more information on
1749 rendering.

1750 5.3 Notification Behavior and State Transitions

1751 Same as human tasks, notifications are in pseudo-state *Inactive* before they are activated. Once they are
1752 activated they move to the *Ready* state. This state is observable, that is, when querying for notifications
1753 then all notifications in state *Ready* are returned. When a notification is removed then it moves into the
1754 final pseudo-state *Removed*.

6 Programming Interfaces

6.1 Operations for Client Applications

A number of applications are involved in the life cycle of a task. These comprise:

- The task list client, i.e. a client capable of displaying information about the task under consideration
- The requesting application, i.e. any partner that has initiated the task
- The supporting application, i.e. an application launched by the task list client to support processing of the task.

The task infrastructure provides access to a given task. It is important to understand that what is meant by *task list client* is the software that presents a UI to one authenticated user, irrespective of whether this UI is rendered by software running on server hardware (such as in a portals environment) or client software (such as a client program running on a users workstation or PC).

A given task exposes a set of operations to this end. A WS-HumanTask Processor MUST provide the operations listed below and ~~a WS-HumanTask Client~~~~an application (such as a task list client) may~~MAY use these operations to manipulate the task. All operations MUST be executed in a synchronous fashion and MUST return a fault if certain preconditions do not hold. For operations that are not expected to return a response they MAY return a void message. The above applies to notifications also.

An operation takes a well-defined set of parameters as its input. Passing an illegal parameter or an illegal number of parameters MUST result in the `hta:illegalArgumentFault` being returned. Invoking an operation that is not allowed in the current state of the task MUST result in an `hta:illegalStateFault`.

By default, the identity of the person on behalf of which the operation is invoked is passed to the task. When the person is not authorized to perform the operation the `hta:illegalAccessFault` and `hta:recipientNotAllowed` MUST be returned in the case of tasks and notifications respectively.

Invoking an operation that does not apply to the task type (e.g., invoking claim on a notification) MUST result in an `hta:illegalOperationFault`.

The language of the person on behalf of which the operation is invoked is assumed to be available to operations requiring that information, e.g., when accessing presentation elements.

For an overview of which operations are allowed in what state, refer to section 4.7 “Human Task Behavior and State Transitions”. For a formal definition of the allowed operations, see [WS-HumanTask Data Types Schema](#)

Note to specification editors: the WS-HumanTask data types XML Schema definition is separately maintained in artifact

Formatte

Formatte

Formatte

1845 For information which generic human roles are authorized to perform which operations, refer to section
 1846 6.1.5 “Operation Authorizations”.

1847 This specification does not stipulate the authentication, language passing, addressing, and binding
 1848 scheme employed when calling an operation. This can be achieved using different mechanisms (e.g. WS-
 1849 Security, WS-Addressing).

1850 6.1.1 Participant Operations

1851 Operations are executed by end users, i.e. actual or potential owners. The identity of the user is implicitly
 1852 passed when invoking any of the operations listed in the table below. The participant operations listed
 1853 below only apply to tasks unless explicitly noted otherwise.

1854 If the task is in a predefined state listed as valid pre-state before the operation is invoked then, upon
 1855 successful completion, the task MUST be in the post state defined for the operation. If the task is in a
 1856 predefined state that is not listed as valid pre-state before the operation is invoked then the operation
 1857 MUST be rejected and MUST NOT cause a task state transition.

1858

Operation Name	Description	Parameters	<u>Pre-State</u>	<u>Post-State</u>
<u>Claimclaim</u>	Claim responsibility for a task, i.e. set the task to status <i>Reserved</i>	In <ul style="list-style-type: none"> task identifier Out <ul style="list-style-type: none"> void 	<u>Ready</u>	<u>Reserved</u>
<u>Startstart</u>	Start the execution of the task, i.e. set the task to status <i>InProgress</i> .	In <ul style="list-style-type: none"> task identifier Out <ul style="list-style-type: none"> void 	<u>Ready</u> <u>Reserved</u>	<u>InProgress</u>
<u>Stopstop</u>	Cancel/stop the processing of the task. The task returns to the <i>Reserved</i> state.	In <ul style="list-style-type: none"> task identifier Out <ul style="list-style-type: none"> void 	<u>InProgress</u>	<u>Reserved</u>
release	Release the task, i.e. set the task back to status <i>Ready</i> .	In <ul style="list-style-type: none"> task identifier Out <ul style="list-style-type: none"> void 	<u>InProgress</u> <u>Reserved</u>	<u>Ready</u>
suspend	Suspend the task.	In <ul style="list-style-type: none"> task identifier Out <ul style="list-style-type: none"> void 	<u>Ready</u> <u>Reserved</u> <u>InProgress</u>	<u>Suspended/Ready (from Ready)</u> <u>Suspended/Reserved (from Reserved)</u> <u>Suspended/InProgress (from InProgress)</u>

suspendUntil	Suspend the task for a given period of time or until a fixed point in time. The WS-HumanTask Client MUST specify either a period of time or a fixed point in time.	In <ul style="list-style-type: none"> task identifier time period point of time Out <ul style="list-style-type: none"> void 	<u>Ready</u> <u>Reserved</u> <u>InProgress</u>	<u>Suspended/Ready (from Ready)</u> <u>Suspended/Reserved (from Reserved)</u> <u>Suspended/InProgress (from InProgress)</u>
resume	Resume a suspended task.	In <ul style="list-style-type: none"> task identifier Out <ul style="list-style-type: none"> void 	<u>Suspended/Ready</u> <u>Suspended/Reserved</u> <u>Suspended/InProgress</u>	<u>Ready (from Suspended/Ready)</u> <u>Reserved (from Suspended/Reserved)</u> <u>InProgress (from Suspended/InProgress)</u>
complete	Execution of the task finished successfully. If no output data is set the operation MUST return <code>hta:illegalArgumentFault</code> .	In <ul style="list-style-type: none"> task identifier output data of task Out <ul style="list-style-type: none"> void 	<u>InProgress</u>	<u>Completed</u>
remove	Applies to notifications only. Used by notification recipients to remove the notification permanently from their task list client. It will not be returned on any subsequent retrieval operation invoked by the same user.	In <ul style="list-style-type: none"> task identifier Out <ul style="list-style-type: none"> void 	<u>Ready (Notification state)</u>	<u>Removed (Notification state)</u>
fail	Actual owner completes the execution of the task raising a	In <ul style="list-style-type: none"> task identifier <ul style="list-style-type: none"> <u>fault</u> 	<u>InProgress</u>	<u>Failed</u>

	<p>fault.</p> <p>The fault <code>hta:illegalOperationFault</code> MUST be returned if the task interface defines no faults. 1859

1860 6.1.2 Simple Query Operations

1861 Simple query operations allow retrieving task data. These operations MUST be supported by a WS-
1862 HumanTask Processor. The identity of the user is implicitly passed when invoking any of the following
1863 operations.

1864

Operation Name	Description	Parameters	Authorization
getMyTaskAbstracts	Retrieve the task abstracts. This operation is used to obtain the data required to display a task list. If no work	In <ul style="list-style-type: none"> task type (“ALL” “TASKS” “NOTIFICATIONS”) generic human role work queue status list where clause 	Any

queue has been specified then only personal tasks MUST be returned. If the work queue is specified then only tasks of that work queue MUST be returned.

The *where* clause MUST reference exactly one column using the following operators: *equals* (“=”), *not equals* (“<>”), *less than* (“<”), *greater than* (“>”), *less than or equals* (“<="), and *greater than or equals* (“>="), e.g., “Task.Priority = 1”).

The *where* clause is logically ANDed with the *created-on* clause, which MUST reference the column Task.CreatedOn with operators as described above.

The combination of the two clauses enables simple but restricted paging in a task list client.

If maxTasks is specified, then the number of task abstracts returned for this query MUST ~~not~~ **NOT** exceed this limit. [The taskIndexOffset can be used to](#)

- [order-by clause](#)
- created-on clause
- maxTasks
- [taskIndexOffset](#)

Out

- list of tasks (list of `htt:tTaskAbstract`)

	<p>perform multiple identical queries and iterate over result sets where the maxTasks size exceeds the query limit.</p>		
<p>getMyTasksgetMyTaskDetails</p>	<p>Retrieve the task details. This operation is used to obtain the data required to display a task list, as well as the details for the individual tasks.</p> <p>If no work queue has been specified then only personal tasks MUST be returned. If the work queue is specified then only tasks of that work queue MUST be returned.</p> <p>The <i>where</i> clause MUST reference exactly one column using the following operators: <i>equals</i> (“=”), <i>not equals</i> (“<>”), <i>less than</i> (“<”), <i>greater than</i> (“>”), <i>less than or equals</i> (“<=”), and <i>greater than or equals</i> (“>=”), e.g., “Task.Priority = 1”.</p> <p>The <i>where</i> clause is logically ANDed with the created-on clause, which MUST reference the column</p>	<p>In</p> <ul style="list-style-type: none"> • task type (“ALL” “TASKS” “NOTIFICATIONS”) • generic human role • work queue • status list • where clause • created-on clause • maxTasks <p>Out</p> <ul style="list-style-type: none"> • list of tasks (list of http://Taskhttp://TaskDetails) 	<p>Any</p>

	<p>Task.CreatedOn with operators as described above. The combination of the two clauses enables simple but restricted paging in the task list client. If maxTasks is specified, then the number of task details returned for this query MUST not NOT exceed this limit.</p>		
--	---	--	--

1865

1866 | The return types `tTaskAbstract` and `tTaskDetails` are defined in section 3.4.4 “Data Types for Task
 1867 Instance Data”.

1868

1869 **Simple Task View**

1870 The table below lists the task attributes available to the simple query operations. This view is used when
 1871 defining the where clause of any of the above query operations.

1872

Column Name	Type
ID	xsd:string
TaskType	Enumeration
Name	xsd: Qname <u>QName</u>
Status	Enumeration (for values see 4.7 “Human Task Behavior and State Transitions”)
Priority	htt:tPriority
CreatedOn	xsd:dateTime
ActivationTime	xsd:dateTime
ExpirationTime	xsd:dateTime
HasPotentialOwners	xsd:boolean
StartByExists	xsd:boolean

CompleteByExists	xsd:boolean
RenderMethExists	xsd:boolean
Escalated	xsd:boolean
PrimarySearchBySearchBy	xsd:string
Outcome	xsd:string

1873

1874 6.1.3 Advanced Query Operation

1875 The advanced query operation is used by the task list client to perform queries not covered by the simple
 1876 query operations defined in 6.1.2. A WS-HumanTask Processor MAY support this operation. An
 1877 implementation MAY restrict the results according to authorization of the invoking user.

1878

Operation Name	Description	Parameters
query	Retrieve task data. All clauses assume a (pseudo-) SQL syntax. If maxTasks is specified, then the number of task returned by the query MUST not NOT exceed this limit. The taskIndexOffset can be used to perform multiple identical queries and iterate over result sets where the maxTasks size exceeds the query limit.	In <ul style="list-style-type: none"> • select clause • where clause • order-by clause • maxTasks • taskIndexOffset Out <ul style="list-style-type: none"> • query result (http:taskQueryResultSet)

1879

1880

1881

1882 ResultSet Data Type

1883 This is the result set element that is returned by the query operation.

```

1884 <xsd:element name="taskQueryResultSet" type="tTaskQueryResultSet" />
1885 <xsd:complexType name="tTaskQueryResultSet">
1886   <xsd:sequence>
1887     <xsd:element name="row" type="tTaskQueryResultRow"
1888       minOccurs="0" maxOccurs="unbounded" />
1889   </xsd:sequence>
1890 </xsd:complexType>
  
```

1891

1892 The following is the type of the row element contained in the result set. The value in the row are returned
 1893 in the same order as specified in the select clause of the query.

```

1894 <xsd:complexType name="tTaskQueryResultRow">
1895   <xsd:choice minOccurs="0" maxOccurs="unbounded">

Complete Task View

1936 The table below is the set of columns used when defining select clause, where clause, and order-by
1937 clause of query operations. Conceptually, this set of columns defines a universal relation. As a result the
1938 query can be formulated without specifying a from clause. A WS-HumanTask Processor MAY extend this
1939 view by adding columns.

1940

Column Name	Type	Constraints
ID	xsd:string	
TaskType	Enumeration	Identifies the task type. The following values are allowed: <ul style="list-style-type: none"> • "TASK" for a human task • "NOTIFICATION" for notifications Note that notifications are simple tasks that do not block the progress of the caller,
Name	xsd:Qname	

Status	Enumeration	For values see section 4.7 "Human Task Behavior and State Transitions"
Priority	htt:tPriority	
UserId	xsd:string	
Group	xsd:string	
GenericHumanRole	xsd:string	
CreatedOn	xsd:dateTime	The time in UTC when the task has been created.
ActivationTime	xsd:dateTime	The time in UTC when the task has been activated.
ExpirationTime	xsd:dateTime	The time in UTC when the task will expire.
Skipable	xsd:boolean	
StartBy	xsd:dateTime	The time in UTC when the task needs to should have been started. This time corresponds to the respective start deadline.
CompleteBy	xsd:dateTime	The time in UTC when the task should have been needs to be completed. This time corresponds to the respective end deadline.
PresentationName	xsd:string	The task's presentation name.
PresentationSubject	xsd:string	The task's presentation subject.
RenderingMethodName	xsd:Qname	The task's rendering method name.
FaultMessage	xsd:any	
InputMessage	xsd:any	
OutputMessage	xsd:any	
AttachmentName	xsd:string	
AttachmentType	xsd:string	
Escalated	xsd:boolean	
PrimarySearchBy SearchBy	xsd:string	

Outcome	xsd:string

1941

1942 6.1.4 Administrative Operations

1943 Operations to be executed for administrative purposes. Actual definition of authorization for operations is
 1944 outside the scope of this specification.

1945

Operation Name	Description	Parameters
activate	Activate the task, i.e. set the task to status <i>Ready</i> .	In <ul style="list-style-type: none"> task identifier Out <ul style="list-style-type: none"> void
nominate	Nominate an organization entity to process the task. If it is nominated to one person then the new state of the task is <i>Reserved</i> . If it is nominated to several people then the new state of the task is <i>Ready</i> . This can only be performed when the task is in the state <i>Created</i> .	In <ul style="list-style-type: none"> task identifier organizational entity (htd:tOrganizationalEntityhtt:tOrganizationalEntity) Out <ul style="list-style-type: none"> void
setGenericHumanRole	Replace the organizational assignment to the task in one generic human role.	In <ul style="list-style-type: none"> task identifier generic human role organizational entity (htd:tOrganizationalEntityhtt:tOrganizationalEntity) Out <ul style="list-style-type: none"> void

1946

1947 6.1.5 Operation Authorizations

1948 This section defines the required authorizations in terms of generic human roles to execute participant,
 1949 query and administrative operations. Thus, it is a precise definition of the generic human roles as well.

Role Operation	Task Initiator	Task Stakeholders	Potential Owners	Actual Owner	Excluded Owners	Business Administrator	Notification Recipients
claim		x	x			x	
start			x (only in state Ready)	x			

stop		X		X		X	
release		X		X		X

1950

1951 **6.2 XPath Extension Functions**

1952 This section introduces XPath extension functions that are provided to be used within the definition of a
 1953 human task or notification. A WS-HumanTask Processor MUST support the ~~Xpath~~ XPath Functions listed
 1954 below. When defining properties using these XPath functions, note the initialization order in section 4.7.1.

1955 Definition of these XPath extension functions is provided in the table below. Input parameters that specify
 1956 task name, message part name or logicalPeopleGroup name MUST be literal strings. This restriction
 1957 does not apply to other parameters. Because XPath 1.0 functions do not support returning faults, an
 1958 empty node set is returned in the event of an error.

1959 XPath functions used for notifications in an escalation can access context from the enclosing task by
 1960 specifying that task's name.

1961

Operation Name	Description	Parameters
getPotentialOwners	Returns the potential owners of the task. It MUST evaluate to an empty <code>htd:organizationalEntity</code> in case of an error. If the task name is not present the current task MUST be considered.	In <ul style="list-style-type: none"> task name (optional) Out <ul style="list-style-type: none"> potential owners (<code>htd:organizationalEntity</code>)
getActualOwner	Returns the actual owner of the task. It MUST evaluate to an empty <code>htd:user</code> in case there is no actual owner. If the task name is not present the current task MUST be considered.	In <ul style="list-style-type: none"> task name (optional) Out <ul style="list-style-type: none"> the actual owner (user id as <code>htd:user</code>)
getTaskInitiator	Returns the initiator of the task. It MUST evaluate to an empty <code>htd:user</code> in case there is no initiator. If the task name is not present the current task MUST be considered.	In <ul style="list-style-type: none"> task name (optional) Out <ul style="list-style-type: none"> the task initiator (user id as <code>htd:user</code>)
getTaskStakeholders	Returns the stakeholders of the task. It MUST evaluate to an empty	In <ul style="list-style-type: none"> task name (optional) Out

	<p>htd:organizationalEntity in case of an error.</p> <p>If the task name is not present the current task MUST be considered.</p>	<ul style="list-style-type: none"> task stakeholders (htd:organizationalEntity)
getBusinessAdministrators	<p>Returns the business administrators of the task. It MUST evaluate to an empty htd:organizationalEntity in case of an error.</p> <p>If the task name is not present the current task MUST be considered.</p>	<p>In</p> <ul style="list-style-type: none"> task name (optional) <p>Out</p> <ul style="list-style-type: none"> business administrators (htd:organizationalEntity)
getExcludedOwners	<p>Returns the excluded owners. It MUST evaluate to an empty htd:organizationalEntity in case of an error.</p> <p>If the task name is not present the current task MUST be considered.</p>	<p>In</p> <ul style="list-style-type: none"> task name (optional) <p>Out</p> <ul style="list-style-type: none"> excluded owners (htd:organizationalEntity)
getTaskPriority	<p>Returns the priority of the task. It MUST evaluate to "5" in case the priority is not explicitly set.</p> <p>If the task name is not present the current task MUST be considered.</p>	<p>In</p> <ul style="list-style-type: none"> task name (optional) <p>Out</p> <ul style="list-style-type: none"> priority (httpPriority)

getLogicalPeopleGroup	<p>Returns the value of a logical people group. In case of an error (e.g., when referencing a non existing logical people group) the htd:organizationalEntity MUST</p>	<p>In</p> <ul style="list-style-type: none"> name of the logical people group The optional parameters that follow MUST appear in pairs. Each pair is defined as:

	<p>contain an empty user list.</p> <p>If the task name is not present the current task MUST be considered.</p>	<ul style="list-style-type: none"> ○ the qualified name of a logical people group parameter ○ the value for the named logical people group parameter; it can be an XPath expression <p>Out</p> <ul style="list-style-type: none"> • the value of the logical people group (htd:organizationalEntityhtt:organizationalEntity)
getOutcome	<p>Returns the outcome of the task. It MUST evaluate to an empty string in case there is no outcome specified for the task.</p> <p>If the task name is not present the current task MUST be considered.</p>	<p>In</p> <ul style="list-style-type: none"> • task name (optional) <p>Out</p> <ul style="list-style-type: none"> • the task outcome (xsd:string)
Union union	<p>Constructs an <code>organizationalEntity</code> containing every user that occurs in either set1 or set2, eliminating duplicate users.</p>	<p>In</p> <ul style="list-style-type: none"> • set1 (htd:organizationalEntityhtt:organizationalEntity htd:usershtt:users htd:userhtt:user) • set2 (htd:organizationalEntityhtt:organizationalEntity htd:usershtt:users htd:userhtt:user) <p>Out</p> <ul style="list-style-type: none"> • result (htd:organizationalEntityhtt:organizationalEntity)
Intersect intersect	<p>Constructs an <code>organizationalEntity</code> containing every user that occurs in both set1 and set2, eliminating duplicate users.</p>	<p>In</p> <ul style="list-style-type: none"> • set1 (htd:organizationalEntityhtt:organizationalEntity htd:usershtt:users htd:userhtt:user) • set2

		<p>(htd:organizationalEntityhtt:organizationalEntity htd:usershtt:users htd:userhtt:user)</p> <p>Out</p> <ul style="list-style-type: none"> • result (htd:organizationalEntityhtt:organizationalEntity)
<p>Exceptexcept</p>	<p>Constructs an organizationalEntity containing every user that occurs in set1 but not in set2.</p> <p>Note: This function is required to allow enforcing the separation of duties ("4-eyes principle").</p>	<p>In</p> <ul style="list-style-type: none"> • set1 (htd:organizationalEntityhtt:organizationalEntity htd:usershtt:users htd:userhtt:user) • set2 (htd:organizationalEntityhtt:organizationalEntity htd:usershtt:users htd:userhtt:user) <p>Out</p> <ul style="list-style-type: none"> • result (htd:organizationalEntityhtt:organizationalEntity)

7 Interoperable Protocol for Advanced Interaction with Human Tasks

1963
1964
1965
1966
1967
1968
1969
1970
1971

Previous sections describe how to define standard invocable Web services that happen to be implemented by human tasks or notifications. Additional capability results from an application that is human task aware, and can control the autonomy and life cycle of the human tasks. To address this in an interoperable manner, a coordination protocol, namely the *WS-HumanTask coordination protocol*, is introduced to exchange life-cycle command messages between an application and an invoked human task. A simplified protocol applies to notifications.

1972

Figure 1: Message Exchange between Application and WS-HumanTask Processor

1973 While we do not make any assumptions about the nature of the application in the following scenarios, in
1974 practice it would be hosted by an infrastructure that actually deals with the WS-HumanTask coordination
1975 protocol on the application's behalf.

1976 In case of human tasks the following message exchanges are possible.

1977 **Scenario 1:** At some point in time, the application invokes the human task through its service interface. In
1978 order to signal to the WS-HumanTask Processor that an instance of the human task can be created
1979 which is actually coordinated by the parent application, this request message contains certain control
1980 information. This control information consists of a coordination context of the WS-HumanTask
1981 coordination protocol, and optional human task attributes that are used to override aspects of the human
1982 task definition.

- 1983 • The coordination context (see [WS-C] for more details on Web services coordination framework
1984 used here) contains the element `CoordinationType` that MUST specify the WS-HumanTask
1985 coordination type [http://docs.oasis-open.org/ns/bpel4people/ws-](http://docs.oasis-open.org/ns/bpel4people/ws-humantask/protocol/200803)
1986 `humantask/protocol/200803`. The inclusion of a coordination context within the request
1987 message indicates that the life cycle of the human tasks is managed via corresponding protocol
1988 messages from outside the WS-HumanTask Processor. The coordination context further contains

1989 in its `RegistrationService` element an endpoint reference that the WS-HumanTask
1990 Processor MUST use to register the task as a participant of that coordination type.
1991 Note: In a typical implementation, the parent application or its environment will create that
1992 coordination context by issuing an appropriate request against the WS-Coordination (WS-C)
1993 activation service, followed by registering the parent application as a `TaskParent` participant in
1994 that protocol.

- 1995 • The optional human task attributes allow overriding aspects of the definition of the human task
1996 from the calling application. The WS-HumanTask Parent MAY set values of the following
1997 attributes of the task definition:
 - 1998 ○ Priority of the task
 - 1999 ○ Actual people assignments for each of the generic human roles of the human task
 - 2000 ○ The skipable indicator which determines whether a task can actually be skipped at
2001 runtime.
 - 2002 ○ The amount of time by which the task activation is deferred.
 - 2003 ○ The expiration time for the human task after which the calling application is no longer
2004 interested in its result.

2005 After having created this request message, it is sent to the WS-HumanTask Processor (step (1) in Figure
2006 1). The WS-HumanTask Processor receiving that message MUST extract the coordination context and
2007 callback information, the human task attributes (if present) and the application payload. Before applying
2008 this application payload to the new human task, the WS-HumanTask Processor MUST register the human
2009 task to be created with the registration service passed as part of the coordination context (step (2) in
2010 Figure 1). The corresponding WS-C `Register` message MUST include the endpoint reference (EPR) of
2011 the protocol handler of the WS-HumanTask Processor that the WS-HumanTask Parent MUST use to
2012 send all protocol messages to WS-HumanTask Processor. This EPR is the value contained in the
2013 `ParticipantProtocolService` element of the `Register` message. Furthermore, the registration
2014 MUST be as a `HumanTask` participant by specifying the corresponding value in the
2015 `ProtocolIdentifier` element of the `Register` message. The WS-HumanTask Parent reacts to that
2016 message by sending back a `RegisterResponse` message. This message MUST contain in its
2017 `CoordinatorProtocolService` element the EPR of the protocol handler of the parent application,
2018 which MUST be used by the WS-HumanTask Processor for sending protocol messages to the parent
2019 application (step (3) in Figure 1).

2020 Now the instance of the human task is activated by the WS-HumanTask Processor, so the assigned
2021 person can perform the task (e.g. the risk assessment). Once the human task is successfully completed,
2022 a response message MUST be passed back to the parent application (step (4a) in Figure 1) by WS-
2023 HumanTask Processor.

2024
2025 **Scenario 2:** If the human task is not completed with a result, but the assigned person determines that the
2026 task can be skipped (and hence reaches its *Obsolete* final state), then a “skipped” coordination protocol
2027 message MUST be sent from the WS-HumanTask Processor to its parent application (step (4b) in Figure
2028 1). No response message is passed back.

2029
2030 **Scenario 3:** If the WS-HumanTask Parent needs to end prematurely before the invoked human task has
2031 been completed, it MUST send an `exit` coordination protocol message to the WS-HumanTask
2032 Processor causing the WS-HumanTask Processor to end its processing. A `Response` message
2033 SHOULD NOT be passed back by WS-HumanTask Processor.

2034
2035 In case of notifications to WS-HumanTask Processor, only some of the overriding attributes are
2036 propagated with the request message. Only priority and people assignments MAY be overridden for a
2037 notification, and the elements `isSkipable`, `expirationTime` and `attachments` MUST be ignored if present by
2038 WS-HumanTask Processor. Likewise, the WS-HumanTask coordination context, `attachments` and the
2039 callback EPR do not apply to notifications and MUST be ignored as well by WS-HumanTask Processor.
2040 Finally, a notification SHOULD NOT return WS-HumanTask coordination protocol messages. There

2041 | SHOULD **NOT** be ~~no a~~ message exchange beyond the initiating request message between the WS-
 2042 | HumanTask Processor and WS-HumanTask Parent.

2043 | 7.1 Human Task Coordination Protocol Messages

2044 | The following section describes the behavior of the human task with respect to the protocol messages
 2045 | exchanged with its requesting application which is human task aware. In particular, we describe which
 2046 | state transitions trigger which protocol message and vice versa. WS-HumanTask Parent MUST support
 2047 | WS-HumanTask Coordination protocol messages in addition to application requesting, responding and
 2048 | fault messages.

2049 | See diagram in section 4.7 “Human Task Behavior and State Transitions”.

- 2050 | 1. The initiating message containing a WS-HumanTask coordination context is received by the WS-
 2051 | HumanTask Processor. This message MAY include ad hoc attachments that are to be made
 2052 | available to the WS-HumanTask Processor. A new task is created. As part of the context, an EPR
 2053 | of the registration service MUST be passed by WS-HumanTask Parent. This registration service
 2054 | MUST be used by the hosting WS-HumanTask Processor to register the protocol handler
 2055 | receiving the WS-HumanTask protocol messages sent by the requesting Application. If an error
 2056 | occurs during the task instantiation the final state *Error* is reached and protocol message *fault*
 2057 | MUST be sent to the requesting application by WS-HumanTask Processor.
- 2058 | 2. On successful completion of the task an application level response message MUST be sent and
 2059 | the task moved to state *Completed*. When this happens, attachments created during the
 2060 | processing of the task MAY be added to the response message. Attachments that had been
 2061 | passed in the initiating message MUST NOT be returned. The response message outcome
 2062 | MUST be set to the outcome of the task.
- 2063 | 3. On unsuccessful completion (completion with a fault message), an application level fault
 2064 | message MUST be sent and the task moved to state *Failed*. When this happens, attachments
 2065 | created during the processing of the task MAY be added to the response message. Attachments
 2066 | that had been passed in the initiating message MUST NOT be returned.
- 2067 | 4. If the task experiences a non-recoverable error protocol message *fault* MUST be sent and
 2068 | the task moved to state *Error*. Attachments MUST NOT be returned.
- 2069 | 5. If the task is skipable and is skipped then the WS-HumanTask Processor MUST send the
 2070 | protocol message *skipped* and task MUST be moved to state *Obsolete*. ~~No a~~Attachments
 2071 | MUST **NOT** be returned.
- 2072 | 6. On receipt of protocol message *exit* the task MUST be moved to state *Exited*. This indicates
 2073 | that the requesting application is no longer interested in any result produced by the task.

2074 | The following table summarizes this behavior, the messages sent, and their direction, i.e., whether a
 2075 | message is sent from the requesting application to the task (“out” in the column titled Direction) or vice
 2076 | versa (“in”).

2077

Message	Direction	Human Task Behavior (and Protocol messages)
application request with WS-HT coordination context	in	Create task (Register)
application response	out	Successful completion with response
application fault response	out	Completion with fault response
htcp:Fault	out	Non-recoverable error
htcp:Exit	in	Requesting application is no longer interested in the task output
htcp:Skipped	out	Task moves to state Obsolete

2078 7.2 Protocol Messages

2079 All WS-HumanTask protocol messages have the following type:

```
2080 <xsd:complexType name="ProtocolMsgType" base="ProtocolMsgType">
2081   <xsd:sequence>
2082     <xsd:any namespace="##other" processContents="lax"
2083       minOccurs="0" maxOccurs="unbounded" />
2084   </xsd:sequence>
2085   <xsd:anyAttribute namespace="##other" processContents="lax" />
2086 </xsd:complexType>
```

2087
2088 This message type is extensible and any implementation MAY use this extension mechanism to define
2089 proprietary attributes and content which are out of the scope of this specification.

2090 7.2.1 Protocol Messages Received by a Task Parent

2091 The following is the definition of the `htcp:skipped` message.

```
2092 <xsd:element name="skipped" type="htcp:ProtocolMsgType" />
2093 <wsdl:message name="skipped">
2094   <wsdl:part name="parameters" element="htcp:skipped" />
2095 </wsdl:message>
```

2096 The `htcp:skipped` message is used to inform the task parent (i.e. the requesting application) that the
2097 invoked task has been skipped. The task does not return any result.

2098 The following is the definition of the `htcp:fault` message.

```
2099 <xsd:element name="fault" type="htcp:ProtocolMsgType" />
2100 <wsdl:message name="fault">
2101   <wsdl:part name="parameters" element="htcp:fault" />
2102 </wsdl:message>
```

2103 The `htcp:fault` message is used to inform the task parent that the task has ended abnormally. The
2104 task does not return any result.

2105 7.2.2 Protocol Messages Received by a Task

2106 Upon receipt of the following `htcp:exit` message the task parent informs the task that it is no longer
2107 interested in its results.

```
2108 <xsd:element name="exit" type="htcp:ProtocolMsgType" />
2109 <wsdl:message name="exit">
2110   <wsdl:part name="parameters" element="htcp:exit" />
2111 </wsdl:message>
```

2112 7.3 WSDL of the Protocol Endpoints

2113 Protocol messages are received by protocol participants via operations of dedicated ports called protocol
2114 endpoints. In this section we specify the WSDL port types of the protocol endpoints needed to run the
2115 WS-HumanTask coordination protocol.

2116 7.3.1 Protocol Endpoint of the Task Parent

2117 An application that wants to create a task and wants to become a task parent MUST provide an endpoint
2118 implementing the following port type. This endpoint is the protocol endpoint of the task parent receiving
2119 protocol messages of the WS-HumanTask coordination protocol from a task. The operation used by the
2120 task to send a certain protocol message to the task parent is named by the message name of the protocol
2121 message concatenated by the string `Operation`. For example, the `skipped` message MUST be passed
2122 to the task parent by using the operation named `skippedOperation`.

```
2123 <wsdl:portType name="clientParticipantPortType">
2124   <wsdl:operation name="skippedOperation">
```

```

2125     <wsdl:input message="htcp:skipped" />
2126   </wsdl:operation>
2127   <wsdl:operation name="faultOperation">
2128     <wsdl:input message="htcp:fault" />
2129   </wsdl:operation>
2130 </wsdl:portType>

```

2131 7.3.2 Protocol Endpoint of the Task

2132 For a WS-HumanTask Definition a task MUST provide an endpoint implementing the following port type.
 2133 This endpoint is the protocol endpoint of the task receiving protocol messages of the WS-HumanTask
 2134 coordination protocol from a task parent. The operation used by the task parent to send a certain protocol
 2135 message to a task is named by the message name of the protocol message concatenated by the string
 2136 Operation. For example, the `exit` protocol message MUST be passed to the task by using the
 2137 operation named `exitOperation`.

```

2138 <wsdl:portType name="humanTaskParticipantPortType">
2139   <wsdl:operation name="exitOperation">
2140     <wsdl:input message="htcp:exit" />
2141   </wsdl:operation>
2142 </wsdl:portType>

```

2143 7.4 Providing Human Task Context

2144 The task context information is exchanged between the requesting application and a task or a notification.
 2145 In case of tasks, this information is passed as header fields of the request and response messages of the
 2146 task's operation. In case of notifications, this information is passed as header fields of the request
 2147 message of the notification's operation.

2148 7.4.1 SOAP Binding of Human Task Context

2149 In general, a SOAP binding specifies for message header fields how they are bound to SOAP headers. In
 2150 case of WS-HumanTask, the `humanTaskContext` element is simply mapped to a single SOAP header
 2151 as a whole. The following listing shows the SOAP binding of the human task context in an infoset
 2152 representation.

```

2153 <S:Envelope xmlns:S="http://www.w3.org/2003/05/soap-envelope"
2154           xmlns:htc="http://docs.oasis-open.org/ns/bpel4people/ws-
2155 humantask/context/200803">
2156   <S:Header>
2157     <htc:humanTaskContext>

2200 7.5 Human Task Policy Assertion

2201 In order to support discovery of Web services that support the human task contract that are available for
2202 coordination by another service, a *human task policy* assertion is defined by WS-HumanTask. This policy
2203 assertion can be associated with the business operation used by the invoking component (recall that the
2204 human task is restricted to have exactly one business operation). In doing so, the provider of a human
2205 task can signal whether or not the corresponding task can communicate with an invoking component via
2206 the WS-HumanTask coordination protocol.

2207 The following describes the policy assertion used to specify that an operation can be used to instantiate a
2208 human task with the proper protocol in place:

```
2209 <http:HumanTaskAssertion wsp:Optional="true"? ...>  
2210 ...  
2211 </http:HumanTaskAssertion>
```

2212

2213 /http:HumanTaskAssertion

2214 | This policy assertion specifies that the WS-HumanTask Parent, in this case the sender, MUST
2215 include context information for a human task coordination type passed with the message. The
2216 receiving human task MUST be instantiated with the WS-Human Task protocol in place by the
2217 WS-HumanTask Processor.

2218

2219 /http:HumanTaskAssertion/@wsp:Optional="true"

2220 As defined in WS-Policy [WS-Policy], this is the compact notation for two policy alternatives, one
2221 with and one without the assertion. Presence of both policy alternatives indicates that the
2222 behavior indicated by the assertion is optional, such that a WS-HumanTask coordination context
2223 MAY be passed with an input message. If the context is passed the receiving human task MUST
2224 be instantiated with the WS-HumanTask protocol in place. The absence of the assertion is
2225 interpreted to mean that a WS-HumanTask coordination context SHOULD NOT be passed with
2226 an input message.

2227

2228 The human task policy assertion indicates behavior for a single operation, thus the assertion has an
2229 Operation Policy Subject. WS-PolicyAttachment [WS-PolAtt] defines two policy attachment points with
2230 Operation Policy Subject, namely wsdl:portType/wsdl:operation and wsdl:binding/wsdl:operation.

2231 The <http:HumanTaskAssertion> policy assertion can also be used for notifications. In that case it
2232 means that the WS-HumanTask Parent, in this case the sender, MAY pass the human task context
2233 information with the message. Other headers, including headers with the coordination context are
2234 ignored.

2235

2236

8 Providing Callback Information for Human Tasks

2237 WS-HumanTask extends the information model of a WS-Addressing endpoint reference (EPR) defined in
2238 [WS-Addr-Core] (see [WS-Addr-SOAP] and [WS-Addr-WSDL] for more details). This extension is needed
2239 to support passing information to human tasks about ports and operations of a caller receiving responses
2240 from such human tasks.

2241 | Passing this callback information from a WS-HumanTask Parent (i.e. a requesting application) to [the](#)
2242 | [aWS-HumanTask Processor -human task](#) MAY override static deployment information that may have
2243 | been set.

8.1 EPR Information Model Extension

2244 Besides the properties of an endpoint reference (EPR) defined by [WS-Addr-Core] WS-HumanTask
2245 defines the following abstract properties:

2247

2248 [response action] : xsd:anyURI (0..1)

2249

2250 This property contains the value of the [action] message addressing property to be sent within the
2251 response message.

2252

2253 [response operation] : xsd:NCName (0..1)

2254

2255 This property contains the name of a WSDL operation.

2256

2257 Each of these properties is a child element of the [metadata] property of an endpoint reference. An
2258 endpoint reference passed by a caller to a WS-HumanTask Processor MUST contain the [metadata]
2259 property. Furthermore, this [metadata] property MUST contain either a [response action] property or a
2260 [response operation] property.

2261 If present, the value of the [response action] property MUST be used by the WS-HumanTask Processor
2262 hosting the responding human task to specify the value of the [action] message addressing property of
2263 the response message sent back to the caller. Furthermore, the [destination] property of this response
2264 message MUST be copied from the [address] property of the EPR contained in the original request
2265 message by the WS-HumanTask Processor.

2266 If present, the value of the [response operation] property MUST be the name of an operation of the port
2267 type implemented by the endpoint denoted by the [address] property of the EPR. The corresponding port
2268 type MUST be included as a WSDL 1.1 definition nested within the [metadata] property of the EPR (see
2269 [WS-Addr-WSDL]). The WS-HumanTask Processor hosting the responding human task MUST use the
2270 value of the [response operation] property as operation of the specified port type at the specified endpoint
2271 to send the response message. Furthermore, the [metadata] property MUST contain WSDL 1.1 binding
2272 information corresponding to the port type implemented by the endpoint denoted by the [address]
2273 property of the EPR.

2274 The EPR sent from the caller to the WS-HumanTask Processor MUST identify the instance of the caller.
2275 This MUST be done by the caller in one of the two ways: First, the value of the [address] property can
2276 contain a URL with appropriate parameters uniquely identifying the caller instance. Second, appropriate
2277 [reference parameters] properties are specified within the EPR. The values of these [reference
2278 parameters] uniquely identify the caller within the scope of the URI passed within the [address] property.

8.2 XML Infoset Representation

2280 The following describes the infoset representation of the EPR extensions introduced by WS-HumanTask:

```
2281 <wsa:EndpointReference>  
2282   <wsa:Address>xsd:anyURI</wsa:Address>
```

```
2283 <wsa:ReferenceParameters>xsd:any*</wsa:ReferenceParameters>?
2284 <wsa:Metadata>
2285   <htcp:responseAction>xsd:anyURI</htcp:responseAction>?
2286   <htcp:responseOperation>xsd:NCName</htcp:responseOperation>?
2287 </wsa:Metadata>
2288 </wsa:EndpointReference>
```

2289
2290 /wsa:EndpointReference/wsa:Metadata
2291 This element of the EPR MUST be sent by WS-HumanTask Parent, the caller, to the WS-
2292 HumanTask Processor . It MUST either contain WSDL 1.1 metadata specifying the information to
2293 access the endpoint (i.e. its port type, bindings or ports) according to [WS-Addr-WSDL] as well as
2294 a <htcp:responseOperation> element, or it MUST contain a <htcp:responseAction>
2295 element.

2296 /wsa:EndpointReference/wsa:Metadata/htcp:responseAction
2297 This element (of type xsd:anyURI) specifies the value of the [action] message addressing
2298 property to be used by the receiving WS-HumanTask Processor when sending the response
2299 message from the WS-HumanTask Processor back to the caller. If this element is specified the
2300 <htcp:responseOperation> element MUST NOT be specified by the caller.

2301 /wsa:EndpointReference/wsa:Metadata/htcp:responseOperation
2302 This element (of type xsd:NCName) specifies the name of the operation that MUST be used by
2303 the receiving WS-HumanTask Processor to send the response message from the WS-
2304 HumanTask Processor back to the caller. ~~The value of this element is taken from the~~
2305 ~~htd:remoteTask/@responseOperation attribute.~~ If this element is specified the
2306 <htcp:responseAction> element MUST NOT be specified by the WS-HumanTask Parent.

2307 Effectively, WS-HumanTask defines two ways to pass callback information from the caller to the human
2308 task. First, the EPR contains just the value of the [action] message addressing property that MUST be
2309 used by the WS-HumanTask Processor within the response message (i.e. the
2310 <htcp:responseAction> element). Second, the EPR contains the WSDL 1.1 metadata for the port
2311 receiving the response operation. In this case, for the callback information the WS-HumanTask Parent
2312 MUST specify which operation of that port is to be used (i.e. the <htcp:responseOperation>
2313 element). In both cases, the response is typically sent to the address specified in the <wsa:Address>
2314 element of the EPR contained in the original request message; note, that [WS-Addr-WSDL] does not
2315 exclude redirection to other addresses than the one specified, but the corresponding mechanisms are out
2316 of the scope of the specification.

2317 The following example of an endpoint reference shows the usage of the <htcp:responseAction>
2318 element. The <wsa:Metadata> elements contain the <htcp:responseAction> element that
2319 specifies the value of the [action] message addressing property to be used by the WS-HumanTask
2320 Processor when sending the response message back to the caller. This value is
2321 http://example.com/LoanApproval/approvalResponse. The value of the [destination] message
2322 addressing property to be used is given in the <wsa:Address> element, namely
2323 http://example.com/LoanApproval/loan?ID=42. Note that this URL includes the HTTP search
2324 part with the parameter ID=42 which uniquely identifies the instance of the caller.

```
2325 <wsa:EndpointReference
2326   xmlns:wsa="http://www.w3.org/2005/08/addressing">
2327
2328   <wsa:Address>http://example.com/LoanApproval/loan?ID=42</wsa:Address>
2329
2330   <wsa:Metadata>
2331     <htcp:responseAction>
2332       http://example.com/LoanApproval/approvalResponse
2333     </htcp:responseAction>
2334   </wsa:Metadata>
2335
2336 </wsa:EndpointReference>
```

2337
2338 The following example of an endpoint reference shows the usage of the `<http:responseOperation>`
2339 element and corresponding WSDL 1.1 metadata. The port type of the caller that receives the response
2340 message from the WS-HumanTask Processor is defined using the `<wsdl:portType>` element. In our
2341 example it is the `LoanApprovalPT` port type. The definition of the port type is nested in a corresponding
2342 WSDL 1.1 `<wsdl:definitions>` element in the `<wsa:Metadata>` element. This
2343 `<wsdl:definitions>` element also contains a binding for this port type as well as a corresponding
2344 port definition nested in a `<wsdl:service>` element. The `<http:responseOperation>` element
2345 specifies that the `approvalResponse` operation of the `LoanApprovalPT` port type is used to send the
2346 response to the caller. The address of the actual port to be used which implements the
2347 `LoanApprovalPT` port type and thus the `approvalResponse` operation is given in the
2348 `<wsa:Address>` element, namely the URL `http://example.com/LoanApproval/loan`. The
2349 unique identifier of the instance of the caller is specified in the `<xmp:MyInstanceID>` element nested in
2350 the `<wsa:ReferenceParameters>` element.

```
2351 <wsa:EndpointReference
2352   xmlns:wsa="http://www.w3.org/2005/08/addressing">
2353
2354   <wsa:Address>http://example.com/LoanApproval/loan</wsa:Address>
2355
2356   <wsa:ReferenceParameters>
2357     <xmp:MyInstanceID>42</xmp:MyInstanceID>
2358   </wsa:ReferenceParameters>
2359
2360   <wsa:Metadata>
2361
2362     <wsdl:definitions ...>
2363
2364       <wsdl:portType name="LoanApprovalPT">
2365         <wsdl:operation name="approvalResponse">...</wsdl:operation>
2366         ...
2367       </wsdl:portType>
2368
2369       <wsdl:binding name="LoanApprovalSoap" type="LoanApprovalPT">
2370         ...
2371       </wsdl:binding>
2372
2373       <wsdl:service name="LoanApprovalService">
2374         <wsdl:port name="LA" binding="LoanApprovalSoap">
2375           <soap:address
2376             location="http://example.com/LoanApproval/loan" />
2377         </wsdl:port>
2378         ...
2379       </wsdl:service>
2380
2381     </wsdl:definitions>
2382
2383     <http:responseOperation>approvalResponse</http:responseOperation>
2384
2385   </wsa:Metadata>
2386
2387 </wsa:EndpointReference>
```

2388 8.3 Message Addressing Properties

2389 Message addressing properties provide references for the endpoints involved in an interaction at the
2390 message level. For this case, WS-HumanTask Processor uses the message addressing properties
2391 defined in [WS-Addr-Core] for the request message as well as for the response message.

2392 The request message sent by the caller (i.e. the requesting application) to the human task uses the
2393 message addressing properties as described in [WS-Addr-Core]. WS-HumanTask refines the use of the
2394 following message addressing properties:

- 2395 • The [reply endpoint] message addressing property MUST contain the EPR to be used by the WS-
2396 HumanTask Processor to send its response to.

2397 Note that the [fault endpoint] property MUST NOT be used by WS-HumanTask Processor. This is
2398 because via one-way operation no application level faults are returned to the caller.

2399 The response message sent by the WS-HumanTask Processor to the caller uses the message
2400 addressing properties as defined in [WS-Addr-Core] and refines the use of the following properties:

- 2401 • The value of the [action] message addressing property is set as follows:
 - 2402 • If the original request message contains the `<http:responseAction>` element in the
2403 `<wsa:Metadata>` element of the EPR of the [reply endpoint] message addressing property,
2404 the value of the former element MUST be copied into the [action] property of the response
2405 message by WS-HumanTask Processor.
 - 2406 • If the original request message contains the `<http:responseOperation>` element (and,
2407 thus, WSDL 1.1 metadata) in the `<wsa:Metadata>` element of the EPR of the [reply
2408 endpoint] message addressing property, the value of the [action] message addressing
2409 property of the response message is determined as follows:
 - 2410 • Assume that the WSDL 1.1 metadata specifies within the binding chosen a value for the
2411 `soapaction` attribute on the `soap:operation` element of the response operation.
2412 Then, this value MUST be used as value of the [action] property by WS-HumanTask
2413 Processor.
 - 2414 • If no such `soapaction` attribute is provided, the value of the [action] property MUST be
2415 derived as specified in [WS-Addr-WSDL] by WS-HumanTask Processor.
- 2416 • Reference parameters are mapped as specified in [WS-Addr-SOAP].

2417 8.4 SOAP Binding

2418 A SOAP binding specifies how abstract message addressing properties are bound to SOAP headers. In
2419 this case, WS-HumanTask Processor MUST use the mappings as specified by [WS-Addr-SOAP].

2420 The following is an example of a request message sent from the caller to the WS-HumanTask Processor
2421 containing the `<http:responseAction>` element in the incoming EPR. The EPR is mapped to SOAP
2422 header fields as follows: The endpoint reference to be used by the human task for submitting its response
2423 message to is contained in the `<wsa:ReplyTo>` element. The address of the endpoint is contained in the
2424 `<wsa:Address>` element. The identifier of the instance of the caller to be encoded as reference
2425 parameters in the response message is nested in the `<wsa:ReferenceParameters>` element. The
2426 value of the `<wsa:Action>` element to be set by the human task in its response to the caller is in the
2427 `<http:responseAction>` element nested in the `<wsa:Metadata>` element of the EPR.

```
2428 <S:Envelope xmlns:S="http://www.w3.org/2003/05/soap-envelope"  
2429   xmlns:wsa="http://www.w3.org/2005/08/addressing"  
2430   xmlns:htcp="http://docs.oasis-open.org/ns/bpel4people/ws-  
2431   humantask/protocol/200803">  
2432  
2433   <S:Header>  
2434     <wsa:ReplyTo>  
2435       <wsa:Address>http://example.com/LoanApproval/loan</wsa:Address>  
2436       <wsa:ReferenceParameters>  
2437         <xmp:MyInstanceID>42</xmp:MyInstanceID>  
2438       </wsa:ReferenceParameters>  
2439       <wsa:Metadata>  
2440         <htcp:responseAction>  
2441           http://example.com/LoanApproval/approvalResponse  
2442         </htcp:responseAction>  
2443       </wsa:Metadata>
```

```
2444     </wsa:ReplyTo>
2445 </S:Header>
2446
2447     <S:Body>...</S:Body>
2448 </S:Envelope>
```

2449 The following is an example of a response message corresponding to the request message discussed
2450 above. This response is sent from the WS-HumanTask Processor back to the caller. The <wsa:To>
2451 element contains a copy of the <wsa:Address> element of the original request message. The
2452 <wsa:Action> element is copied from the <htcp:responseAction> element of the original request
2453 message. The reference parameters are copied as standalone elements (the <xmp:MyInstanceID>
2454 element below) out of the <wsa:ReferenceParameters> element of the request message.

```
2455 <S:Envelope xmlns:S="http://www.w3.org/2003/05/soap-envelope"
2456   xmlns:wsa="http://www.w3.org/2005/08/addressing">
2457   <S:Header>
2458     <wsa:To>
2459       <wsa:Address>http://example.com/LoanApproval/loan</wsa:Address>
2460     </wsa:To>
2461     <wsa:Action>
2462       http://example.com/LoanApproval/approvalResponse
2463     </wsa:Action>
2464     <xmp:MyInstanceID wsa:IsReferenceParameter='true'>
2465       42
2466     </xmp:MyInstanceID>
2467   </S:Header>
2468   <S:Body>...</S:Body>
2469 </S:Envelope>
```

2470 The following is an example of a request message sent from the caller to the WS-HumanTask Processor
2471 containing the <htcp:responseOperation> element and corresponding WSDL metadata in the
2472 incoming EPR. The EPR is mapped to SOAP header fields as follows: The endpoint reference to be used
2473 by the WS-HumanTask Processor for submitting its response message to is contained in the
2474 <wsa:ReplyTo> element. The address of the endpoint is contained in the <wsa:Address> element.
2475 The identifier of the instance of the caller to be encoded as reference parameters in the response
2476 message is nested in the <wsa:ReferenceParameters> element. The WSDL metadata of the
2477 endpoint is contained in the <wsdl:definitions> element. The name of the operation of the endpoint
2478 to be used to send the response message to is contained in the <htcp:responseOperation>
2479 element. Both elements are nested in the <wsa:Metadata> element of the EPR. These elements
2480 provide the basis to determine the value of the action header field to be set by the WS-HumanTask
2481 Processor in its response to the caller.

```
2482 <S:Envelope xmlns:S="http://www.w3.org/2003/05/soap-envelope"
2483   xmlns:wsa="http://www.w3.org/2005/08/addressing"
2484   xmlns:htcp="http://docs.oasis-open.org/ns/bpel4people/ws-
2485   humantask/protocol/200803">

```

2532 The following is an example of a response message corresponding to the request message before; this
 2533 response is sent from the WS-HumanTask Processor back to the caller. The `<wsa:To>` element contains
 2534 a copy of the `<wsa:Address>` field of the original request message. The reference parameters are
 2535 copied as standalone element (the `<xmp:MyInstanceID>` element below) out of the
 2536 `<htcp:ReferenceParameters>` element of the request message. The value of the `<wsa:Action>`
 2537 element is composed according to [WS-Addr-WSDL] from the target namespace, port type name, name
 2538 of the response operation to be used, and name of the input message of this operation given in the code
 2539 snippet above.

```

2540 <S:Envelope xmlns:S="http://www.w3.org/2003/05/soap-envelope"
2541     xmlns:wsa="http://www.w3.org/2005/08/addressing"
2542     xmlns:htd="http://docs.oasis-open.org/ns/bpel4people/ws-humantask/200803">
2543     <S:Header>
2544         <wsa:To>http://example.com/LoanApproval/loan</wsa:To>
2545         <wsa:Action>
2546             http://example.com/loanApproval/...
2547             ...LoanApprovalPT/approvalResponse/ApprovalInput
2548         </wsa:Action>
2549         <xmp:MyInstanceID wsa:IsReferenceParameter='true'>
2550             42
2551         </xmp:MyInstanceID>
2552     </S:Header>
2553     <S:Body>...</S:Body>
2554 </S:Envelope>

```

2555

9 Security Considerations

2556 WS-HumanTask does not mandate the use of any specific mechanism or technology for client
2557 authentication. However, a client MUST provide a principal or the principal MUST be obtainable by the
2558 [infrastructureWS-HumanTask Processor](#).

2559 When using task APIs via SOAP bindings, compliance with the WS-I Basic Security Profile 1.0 is
2560 RECOMMENDED.

2561 **10 Conformance**

A. Portability and Interoperability Considerations

2620 This section illustrates the portability and interoperability aspects addressed by WS-HumanTask:

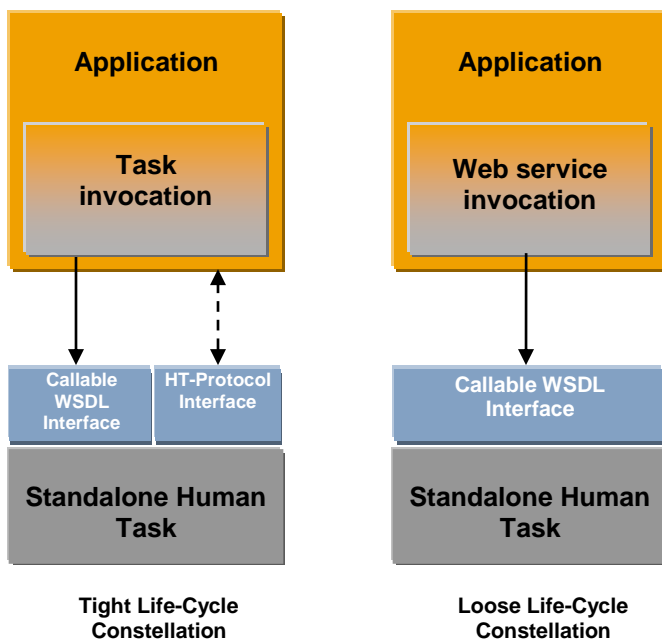

- 2621 • Portability - The ability to take human tasks and notifications created in one vendor's environment
2622 and use them in another vendor's environment.
- 2623 • Interoperability - The capability for multiple components (task infrastructure, task list clients and
2624 applications or processes with human interactions) to interact using well-defined messages and
2625 protocols. This enables combining components from different vendors allowing seamless
2626 execution.

2627 Portability requires support of WS-HumanTask artifacts.

2628 Interoperability between task infrastructure and task list clients is achieved using the operations for client
2629 applications.

2630 Interoperability between applications and task infrastructure from different vendors subsumes two
2631 alternative constellations depending on how tightly the life-cycles of the task and the invoking
2632 application are coupled with each other. This is shown in the figure below:

2633 Tight Life-Cycle Constellation: Applications are human task aware and control the life cycle of tasks.
2634 Interoperability between applications and WS-HumanTask Processors is achieved using the WS-
2635 HumanTask coordination protocol.

2636 Loose Life-Cycle Constellation: Applications use basic Web services protocols to invoke Web services
2637 implemented as human tasks. In this case standard Web services interoperability is achieved and
2638 applications do not control the life cycle of tasks.

2639

B. WS-HumanTask Language Schema

2640
2641

Note to specification editors: the WS-HumanTask XML Schema definition is separately maintained in an artifact

2642

ws-humantask.xsd

2643
2644

The contents of this artifact shall be copied back into this section before publishing the specification, e.g., as a committee draft.

2645

C. WS-HumanTask Data Types Schema

2646
2647

Note to specification editors: the WS-HumanTask data types XML Schema definition is separately maintained in artifact

2648

ws-humantask-types.xsd

2649
2650

The contents of this artifact shall be copied back into this section before publishing the specification, e.g., as a committee draft.

2651

D. WS-HumanTask API Port Types

2652 Note to specification editors: the WS-HumanTask API WSDL definition is separately maintained in artifact

2653 ws-humantask-api.wsdl

2654 The contents of this artifact shall be copied back into this section before publishing the specification, e.g.,
2655 as a committee draft.

2656

E. WS-HumanTask Protocol Handler Port Types

2657

Note to specification editors: the WS-HumanTask protocol WSDL definition is separately maintained in an artifact

2658

2659

`ws-humantask-protocol.wsdl`

2660

The contents of this artifact shall be copied back into this section before publishing the specification, e.g.,

2661

as a committee draft.

2662

F. WS-HumanTask Context Schema

2663 Note to specification editors: the WS-HumanTask context XML Schema definition is separately
2664 maintained in an artifact

2665 ws-humantask-context.xsd

2666 The contents of this artifact shall be copied back into this section before publishing the specification, e.g.,
2667 as a committee draft.

2668

G. WS-HumanTask Policy Assertion Schema

2669 Note to specification editors: the WS-HumanTask policy assertion XML Schema definition is separately
2670 maintained in an artifact

2671 ws-humantask-policy.xsd

2672 The contents of this artifact shall be copied back into this section before publishing the specification, e.g.,
2673 as a committee draft.

2674

H. Sample

2675 This appendix contains the full sample used in this specification.

2676

2677 **WSDL Definition**

2678 Note to specification editors: the WS-HumanTask example WSDL definition is separately maintained in
2679 an artifact

2680 `ws-humantask-example-claim-approval.wsdl`

2681 The contents of this artifact shall be copied back into this section before publishing the specification, e.g.,
2682 as a committee draft.

2683

2684 **Human Interaction Definition**

2685 Note to specification editors: the WS-HumanTask example Human Task definition is separately
2686 maintained in an artifact

2687 `ws-humantask-example-claim-approval.tel`

2688 The contents of this artifact shall be copied back into this section before publishing the specification, e.g.,
2689 as a committee draft.

K. Revision History

2765 [optional; should not be included in OASIS Standards]

2766

Revision	Date	Editor	Changes Made
WD-01	2008-03-12	Dieter König	First working draft created from submitted specification
WD-02	2008-03-13	Dieter König	Added specification editors Moved WSDL and XSD into separate artifacts
WD-02	2008-06-25	Ivana Trickovic	Resolution of Issue #4 incorporated into the document/section 2.4.2
WD-02	2008-06-25	Ivana Trickovic	Resolution of Issue #4 incorporated into the ws-humantask.xsd
WD-02	2008-06-25	Ivana Trickovic	Resolution of Issue #8 incorporated into the document/section 6.2
WD-02	2008-06-25	Ivana Trickovic	Resolution of Issue #9 incorporated into the document/section 4.6 (example), and ws-humantask "ClaimApproval" example and WSDL file
WD-02	2008-06-28	Dieter König	Resolution of Issue #13 applied to complete document and all separate XML artifacts
WD-02	2008-06-28	Dieter König	Resolution of Issue #21 applied to section 2
WD-02	2008-07-08	Ralf Mueller	Resolution of Issue #14 applied to section 6, ws-humantask-api.wsdl and ws-humantask-types.xsd
WD-02	2008-07-15	Luc Clément	Updated Section 6.2 specifying (xsd:nonNegativeInteger) as the type for priority
WD-02	2008-07-25	Krasimir Nedkov	Resolution of Issue #18 applied to this document and all related XML artifacts. Completed the resolution of Issue #7 by adding the attachmentType input parameter to the addAttachment operation in section 6.1.1.
WD-02	2008-07-29	Ralf Mueller	Update of resolution of issue #14 applied to section 3.4.4, 6.1.2 and ws-humantask-types.xsd
CD-01-rev-1	2008-09-24	Dieter König	Resolution of Issue #25 applied to section 3.4.3.1 and ws-humantask-types.xsd
CD-01-rev-2	2008-10-02	Ralf Mueller	Resolution of Issue #17 applied to section 2.3

			Resolution of Issue #24 applied to section 7 and ws-humantask-context.xsd
CD-01-rev-3	2008-10-20	Dieter König	Resolution of Issue #23 applied to section 3.2.1 Resolution of Issue #6 applied to section 6.2 Resolution of Issue #15 applied to section 6.2 Formatting (Word Document Map)
CD-01-rev-4	2008-10-29	Michael Rowley	Resolution of Issue #2 Resolution of Issue #40
CD-01-rev-5	2008-11-09	Vinkesh Mehta	Issue-12, Removed section 7.4.1, Modified XML artifacts in bpel4people.xsd, humantask.xsd, humantask-context.xsd
CD-01-rev-6	2008-11-10	Vinkesh Mehta	Issue-46, Section 6.1.1 wrap getFaultResponse values into single element
CD-01-rev-7	2008-11-10	Vinkesh Mehta	Issue-35, section 6.1.1 remove potential owners from the authorized list of suspended, suspendUntil and resume
CD-01-rev-8	2008-11-21	Ivana Trickovic	Issue-16, sections 1, 2, 3, and 6
CD-01-rev-9	2008-11-21	Dieter König	Issue-16, sections 4, 5
CD-01-rev10	2008-11-30	Vinkesh Mehta	Issue-16, sections 7,8,9,10,11 Appendix A through H
CD-01-rev11	2008-12-15	Vinkesh Mehta	Issue-16, Updates based upon Dieter's comments
CD-01-rev-12	2008-12-17	Ivana Trickovic	Issue-16, sections 1, 2, 3, and 6 updates based on comments
CD-01-rev-13	2008-12-17	Dieter König	Issue-16, sections 4, 5 updates based on comments
CD-01-rev-14	2008-12-23	Vinkesh Mehta	Issue-16, Updates based upon Ivana's comments
CD-01-rev-15	2009-01-06	Krasimir Nedkov	Issue-43. Added section 6.1.5, column "Authorization" removed from the tables in section 6.1, edited texts in section 6.1.
CD-02	2009-02-18	Luc Clément	Committee Draft 2
CD-02-rev-1	2009-02-20	Dieter König	Issue 20, sections 4, 4.7 and 6.1.1 Issue 50, sections 3, 4, 6, 7 (htd:→htt) Issue 55, section 2.5.2 (import type xsd) Issue 56, section 7.2 (tProtocolMsgType) Issue 60, section 6.1.1 (API fault type) Issue 61, sections 3.4.4, 6.1 (taskDetails)
CD-02-rev-2	2009-02-22	Luc Clément	Issue 68, section 8.2 (XML Infoset) – removal of erroneous statement regarding the source of the value for the

CD-02-rev-3	2009-02-22	Michael Rowley	responseOperation Issue 44, section 6.1.1 plus ws-humantask.xsd and ws-humantask-api.wsdl
CD-02-rev-4	2009-03-05	Dieter König	Action Item 17
CD-02-rev-5	2009-03-09	Ralf Mueller	Issue 70, section 6.1.2
CD-02-rev-6	2009-03-13	Dieter König	Issue 71, section 3.4 and 6.1
