Abstract:

Web Services Business Process Execution Language, version 2.0 (WS-BPEL 2.0 or BPEL for brevity) introduces a model for business processes based on Web services. A BPEL process orchestrates interactions among different Web services. The language encompasses features needed to describe complex control flows, including error handling and compensation behavior. In practice, however many business process scenarios require human interactions. A process definition should incorporate people as another type of participants, because humans may also take part in business processes and can influence the process execution.

This specification introduces a BPEL extension to address human interactions in BPEL as a first-class citizen. It defines a new type of basic activity which uses human tasks as an implementation, and allows specifying tasks local to a process or use tasks defined outside of the process definition. This extension is based on the WS-HumanTask specification.

Status:

This document was last revised or approved by the OASIS WS-BPEL Extension for People Technical Committee on the above date. The level of approval is also listed above. Check the "Latest Version" or "Latest Approved Version" location noted above for possible later revisions of this document.

Technical Committee members should send comments on this specification to the Technical Committee's email list. Others should send comments to the Technical Committee by using the "Send A Comment" button on the Technical Committee's web page at http://www.oasis-open.org/committees/bpel4people/.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (http://www.oasis-open.org/committees/bpel4people/ipr.php.

The non-normative errata page for this specification is located at http://www.oasis-open.org/committees/bpel4people/.

1 Introduction

- 198 This specification introduces an extension to BPEL in order to support a broad range of scenarios that 199 involve people within business processes.
- 200 The BPEL specification focuses on business processes the activities of which are assumed to be interactions with Web services, without any further prerequisite behavior. But the spectrum of activities 201 202 that make up general purpose business processes is much broader. People often participate in the 203 execution of business processes introducing new aspects such as interaction between the process and user interface, and taking into account human behavior. This specification introduces a set of elements 204 which extend the standard BPEL elements and enable the modeling of human interactions, which may 205 range from simple approvals to complex scenarios such as separation of duties, and interactions 206 207 involving ad-hoc data.
- 208 The specification introduces the people activity as a new type of basic activity which enables the 209 specification of human interaction in processes in a more direct way. The implementation of a people activity could be an inline task or a standalone human task defined in the WS-HumanTask specification 210 [WS-HumanTask]. The syntax and state diagram of the people activity and the coordination protocol that 211 212 allows interacting with human tasks in a more integrated way is described. The specification also
- 213 introduces XPath extension functions needed to access the process context.
- 214 The goal of this specification is to enable portability and interoperability:
- Portability The ability to take design-time artifacts created in one vendor's environment and use them in 215 216 another vendor's environment.
- 217 Interoperability - The capability for multiple components (process infrastructure, task infrastructures and
- task list clients) to interact using well-defined messages and protocols. This enables combining 218
- components from different vendors allowing seamless execution. 219
- 220 Out of scope of this specification is how processes with human interactions are deployed or monitored.
- 221 Usually people assignment is accomplished by performing queries on a people directory which has a
- certain organizational model. The mechanism of how an implementation evaluates people assignments, 222
- as well as the structure of the data in the people directory is also out of scope. 223

2 Language Design

- 225 The BPEL4People extension is defined in a way that it is layered on top of BPEL so that its features can
- 226 be composed with BPEL features whenever needed. All elements and attributes introduced in this
- 227 extension are made available to both BPEL executable processes and abstract processes.
- 228 This extension introduces a set of elements and attributes to cover different complex human interaction
- patterns, such as separation of duties, which are not defined as first-class elements. 229
- 230 Throughout this specification, WSDL and schema elements may be used for illustrative or convenience
- 231 purposes. However, in a situation where those elements or other text within this document contradict the
- separate BPEL4People, WS-HumanTask, WSDL or schema files, it is those files that have precedence 232
- 233 and not this document.

224

2.1 Dependencies on Other Specifications 234

- 235 BPEL4People utilizes the following specifications:
- WS-BPEL 2.0: BPEL4People extends the WS-BPEL 2.0 process model and uses existing WS-BPEL 2.0 236
- 237 capabilities, such as those for data manipulation.
- 238 WS-HumanTask 1.0: BPEL4People uses the definition of human tasks and, notifications, and extends
- 239 generic human roles and people assignments introduced in WS-HumanTask 1.0.
- 240 WSDL 1.1: BPEL4People uses WSDL for service interface definitions.
- XML Schema 1.0: BPEL4People utilizes XML Schema data model. 241
- XPath 1.0: BPEL4People uses XPath as default guery and expression language. 242

2.2 Notational Conventions 243

- The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described 244
- 245
- in RFC 2119 [RFC 2119]. 246

247

249

250

251

255

2.3 Conformance Targets

- 248 As part of this specification, the following conformance targets are specified
 - **BPEL4People Definition**
 - A BPEL4People Definition is a WS-BPEL 2.0 process definition that uses the BPEL4People extensions to WS-BPEL 2.0 specified in this document.
- 252 **BPEL4People Processor**
- A BPEL4People Processor is any implementation that accepts a BPEL4People definition and 253 254 executes the semantics defined in this document.

2.4 Language Extensibility

- 256 The BPEL4People specification extends the reach of the standard BPEL extensibility mechanism to
- BPEL4People elements. This allows: 257
- 258 Attributes from other namespaces to appear on any BPEL4People element
- Elements from other namespaces to appear within BPEL4People elements 259
- Extension attributes and extension elements MUST NOT contradict the semantics of any attribute or 260
- 261 element from the BPEL4People namespace.
- 262 The standard BPEL element <extension> MUST be used to declare mandatory and optional
- 263 extensions of BPEL4People.

2.5 Overall Language Structure

This section explains the structure of BPEL4People extension elements, including the new activity type people activity, inline human tasks and people assignments.

2.5.1 Syntax

264 265

266

267

268 269 Informal syntax of a BPEL process and scope containing logical people groups, inline human tasks, and people activity follows.

```
270
       <bpel:process ...</pre>
271
272
         xmlns:b4p="http://docs.oasis-open.org/ns/bpel4people/bpel4people/200803"

       humantask/200803"
282
283
             mustUnderstand="yes"/>
284
         </bre>
285
286
287
            importType="http://docs.oasis-open.org/ns/bpel4people/ws-
       humantask/200803" .../>
288
289
290
291
         <br/><b4p:humanInteractions>?
292
293
            <htd:logicalPeopleGroups/>?
294
              <htd:logicalPeopleGroup name="NCName" reference="QName"?>+
295
              </htd:logicalPeopleGroup>
296
297
           </htd:logicalPeopleGroups>
298
299
           <htd:tasks>?
300
             <htd:task name="NCName">+
301
              </htd:task>
302
303
            </htd:tasks>
304
305
            <htd:notifications>?
306
              <htd:notification name="NCName">+
307
              </htd:notification>
308
309
            </htd:notifications>
310
         </ba></bap:humanInteractions>
311
312
313
         <br/><b4p:peopleAssignments>?
314
315
         </bd></bd>

</p
316
317
318
         <bpel:extensionActivity>
```

```
319
          <br/><b4p:peopleActivity name="NCName" ...>
320
321
          </bd></bd>
322
        </bpel:extensionActivity>
323
324
     </bpel:process>
```

325 A BPEL4People Definition MUST use BPEL4People extension elements and elements from WS-HumanTask namespace. Therefore elements from namespaces BPEL4People and WS-HumanTask 326 327 MUST be understood.

328 The element
b4p:humanInteractions> is optional and contains declarations of elements from WS-329 HumanTask namespace, that is <htd:logicalPeopleGroups>, <htd:tasks> and 330 <htd:notifications>.

 $The \ element < \verb|htd:logicalPeopleGroup|| \ specifies \ a \ logical \ people \ group \ used \ in \ an \ inline \ human$ 331 332 task or a people activity. The name attribute specifies the name of the logical people group. The name 333 MUST be unique among the names of all logical people groups defined within the 334
<b4p:humanInteractions> element.

335 The <htd:task> element is used to provide the definition of an inline human task. The syntax and 336 semantics of the element are provided in the WS-HumanTask specification. The name attribute specifies 337 the name of the task. The name MUST be unique among the names of all tasks defined within the 338

The <htd:notification> element is used to provide the definition of an inline notification. The syntax and semantics of the element are provided in the WS-HumanTask specification. The name attribute specifies the name of the notification. The name MUST be unique among the names of all notifications defined within the https://defined.notifications element.

The element
 b4p:peopleAssignments> is used to assign people to process-related generic human roles. This element is optional. The syntax and semantics are introduced in section 3.1 "Generic Human Roles".

New activity type <b4p:peopleActivity> is used to model human interactions within BPEL processes. The new activity is included in the BPEL activity depel:extensionActivity which is used as wrapper. The syntax and semantics of the people activity are introduced in section 4 "People Activity".

```
<bpel:scope ...>
  <bd><bdp:humanInteractions>?</bd>
  </bd></bd></ri>
  <bpel:extensionActivity>
    <b4p:peopleActivity name="NCName" ...>
  </bpel:extensionActivity>
</bpel:scope>
```

BPEL scopes can also include elements from BPEL4People and WS-HumanTask namespaces except for the <b4p:peopleAssignments> element.

All BPEL4People Definition elements MAY use the element
b4p:documentation> to provide annotation for users. The content could be a plain text, HTML, and so on. The <b4p:documentation> element is optional and has the following syntax:

```
<b4p:documentation xml:lang="xsd:language">
</bd></bd></ri>
```

368

3 Concepts

372 Many of the concepts in BPEL4People are inherited from the WS-HumanTask specification so familiarity

with this specification is assumed. 373

3.1 Generic Human Roles

375 Process-related generic human roles define what a person or a group of people resulting from a people 376 assignment can do with the process instance. The process-related human roles complement the set of

generic human roles specified in [WS-HumanTask]. There are three process-related generic human roles: 377

378 Process initiator

371

374

380

393

394

395 396

397

399

407

408

- 379 Process stakeholders
 - **Business administrators**

381 Process initiator is the person associated with triggering the process instance at its creation time. The initiator is typically determined by the infrastructure automatically. This can be overridden by specifying a 382 383 people assignment for process initiator. A BPEL4People Definition MAY define assignment for this generic human role. A compliant BPEL4People Processor MUST ensure that at runtime at least one 384

person is associated with this role. 385

386 Process stakeholders are people who can influence the progress of a process instance, for example, by adding ad-hoc attachments, forwarding a task, or simply observing the progress of the process instance. 387 388 The scope of a process stakeholder is broader than the actual BPEL4People specification outlines. The 389 process stakeholder is associated with a process instance. If no process stakeholders are specified, the process initiator becomes the process stakeholder. A BPEL4People Definition MAY define assignment for 390 this generic human role. A compliant BPEL4People Processor MUST ensure that at runtime at least one 391 person is associated with this role. 392

Business administrators are people allowed to perform administrative actions on the business process, such as resolving missed deadlines. A business administrator, in contrast to a process stakeholder, has an interest in all process instances of a particular process type, and not just one. If no business administrators are specified, the process stakeholders become the business administrators. A BPEL4People Definition MAY define assignment for this generic human role. A compliant BPEL4People

398 Processor MUST ensure that at runtime at least one person is associated with this role.

3.1.1 Syntax

```
400
      <br/><b4p:peopleAssignments>?
401
402
         <htd:genericHumanRole>+
403
           <htd:from>...</htd:from>
404
         </htd:genericHumanRole>
405
406
      <br/><b4p:peopleAssignments>
```

The genericHumanRole abstract element introduced in the WS-HumanTask specification is extended with the following process-related human roles.

```
409
      <b4p:peopleAssignments>?
410
411
        <b4p:processInitiator>?
412
          <htd:from ...>...</htd:from>
413
        </bd></bdp:processInitiator>
414
415
        <b4p:processStakeholders>?

- 424 Only process-related human roles MUST be used within the <baseline 424 p:peopleAssignments> element.
- People are assigned to these roles as described in section 3.2 ("Assigning People").

3.1.2 Initialization Behavior

426

- 427 Assigning people to process-related generic human roles happens after BPEL process initialization (see
- 428 [WS-BPEL 2.0], section 12.1). A BPEL4People Processor MUST initialize process-related generic human
- 429 roles after the end of the initial start activity of the process and before processing other activities or links
- 430 leaving the start activity. If that initialization fails then the fault b4p:initializationFailure MUST be
- 431 thrown by a BPEL4People Processor.

432 3.2 Assigning People

- 433 To determine who is responsible for acting on a process, a human task or a notification in a certain
- 434 generic human role, people need to be assigned. People assignment can be achieved in different ways:
- Via logical people groups (see 3.2.1 "Using Logical People Groups")
- 436 Via literals (as introduced section 3.2.2 in [WS-HumanTask])
- 437 Via expressions (see 3.2.2 "Computed Assignment")
- When specifying people assignments then the data type
- 439 | htd:torganizationalEntityhtt:torganizationalEntity defined in [WS-HumanTask] is used.
- 440 Using htd:tOrganizationalEntityhtt:tOrganizationalEntity allows to assign either a list of
- users or a list of unresolved groups of people ("work queues").

442 3.2.1 Using Logical People Groups

- 443 This section focuses on describing aspects of logical people groups that are specific to business
- processes. Logical people groups define which person or set of people can interact with a human task or
- a notification of a people activity. Details about how logical people groups are used with human tasks and
- 446 notifications are provided by the WS-HumanTask specification.
- 447 Logical people groups can be specified as part of the business process definition. They can be defined
- 448 either at the process level or on enclosed scopes. Definitions on inner scopes override definitions on
- outer scopes or the process respectively.
- Logical people group definitions can be referenced by multiple people activities. Each logical people
- group is bound to a people query during deployment.
- 452 In the same way as in WS-HumanTask, a logical people group has one instance per set of unique
- 453 arguments. Whenever a logical people group is referenced for the first time with a given set of unique
- 454 arguments, a new instance MUST be created by the BPEL4People Processor. To achieve that, the
 455 logical people group MUST be evaluated / resolved for this set of arguments. Whenever a logical people
- 456 group is referenced for which an in-stance already exists (i.e., it has already referenced before with the
- 457 same set of arguments), the logical people group MAY be re-evaluated / re-resolved.
- 458 In particular, for a logical people group with no parameters, there is a single instance, which MUST be
- 459 evaluated / resolved when the logical people group is first referenced, and which MAY be re-evaluated /
- 460 re-resolved when referenced again.

465

- Hence, using the same logical people group does not necessarily mean that the result of a people query
- 462 is re-used, but that the same query is used to obtain a result. If the result of a previous people query
- 463 needs to be re-used, then this result needs to be referenced explicitly from the process context. Please
- refer to section 5 "XPath Extension Functions" for a description of the syntax.

Assignment of Logical People Groups

A BPEL4People Definition MAY use the <assign> activity (see [WS-BPEL 2.0] section 8.4 for more details) to manipulate values of logical people group. A mechanism to assign to a logical people group or to assign from a logical people group using BPEL copy assignments is provided. The semantics of the <copy> activity introduced in [WS-BPEL 2.0] (see sections 8.4.1, 8.4.2 and 8.4.3 for more details) applies.

BPEL4People extends the from-spec and to-spec forms introduced in [WS-BPEL 2.0] as shown below:

```
<bpel:from b4p:logicalPeopleGroup="NCName">
  <bdp:argument name="NCName" expressionLanguage="anyURI"?>*
    value
  </base>
</bpel:from>
<to b4p:logicalPeopleGroup="NCName"/>
```

In this form of from-spec and to-spec the b4p:logicalPeopleGroup attribute provides the name of a logical people group. The from-spec variant MAY include zero or more

b4p:argument> elements in order to pass values used in the people query. The expressionLanguage attribute specifies the language used in the expression. The attribute is optional. If not specified, the default language as inherited from the closest enclosing element that specifies the attribute is used.

Using a logical people group in the from-spec causes the evaluation of the logical people group. Logical people groups return data of type htt:torganizationalEntity. This data can be manipulated and assigned to other process variables using standard BPEL to-spec variable variants.

The new form of the from-spec can be used with the following to-spec variants:

· To copy to a variable

466

467 468

469

```

To copy from a logical people group

```
<bpel:from b4p:logicalPeopleGroup="NCName"/>
```

Below are several examples illustrating the usage of logical people groups in copy assignments. The first example shows assigning the results of the evaluation of a logical people group to a process variable.

```
<bpel:assign name="getVoters">
  <bpel:copy>
    <bpel:from b4p:logicalPeopleGroup="voters">
      <br/><b4p:argument name="region">
        $electionRequest/region
      </bar></bareargument>
    </bpel:from>
    <bpel:to variable="voters" />
  </bpel:copy>
</bpel:assign>
```

The next example demonstrates assigning a set of people to a logical people group using literal values.

```
<bpel:assign>
  <br/><bpel:copy>
    <br/><bpel:from>
     <bpel:literal>
       <mvns:entity
        ="htd:tOrganizationalEntityhtt:tOrganizationalEntity">
          <htd:users>
           <htd:user</pre>htt:user>Alan/htd:user
           <a href="htt:user">htt:user</a>>
           <htd:user>Frank</htd:user>htt:user>
           <htd:userhtt:user>Gerhard</htd:userhtt:user>
           <htd:userhtt:user>Ivana</htd:userhtt:user>
           <a href="htt:user">htt:user>Karsten</a></a>
           <htd:userhtt:user>Matthias</htd:userhtt:user>
```

606

All computed assignment variants described in [WS-HumanTask] (see section 3.2 "Assigning People" for more details) are supported. In addition, the following variant is possible:

All other process context can be accessed using expressions of the following style:

```
<bpel:from expressionLanguage="anyURI"?>expression</bpel:from>
```

with XPath extension functions defined in section 5 "XPath Extension Functions". The expressionLanguage attribute specifies the language used in the expression. The attribute is optional. If not specified, the default language as inherited from the closest enclosing element that specifies the attribute is used.

3.3 Ad-hoc Attachments

Processes can have ad-hoc attachments. It is possible to exchange ad-hoc attachments between people activities of a process by propagating ad-hoc attachments to and from the process level.

When a people activity is activated, attachments from earlier tasks and from the process can be propagated to its implementing human task. On completion of the human task, its ad-hoc attachments can be propagated to the process level, to make them globally available.

In all cases, if several attachments of the same name are propagated, they are combined into a list of attachments with that name; no attachment is lost or overwritten.

All manipulations of ad-hoc attachments at the process level are instantaneous, and not subject to compensation or isolation.

641

People activity is a basic activity used to integrate human interactions within BPEL processes. The following figure illustrates different ways in which human interactions (including human tasks and notifications) could be integrated.

BPEL Process BPEL Process BPEL Process BPEL Process People People People Activity Activity Activity Inline **Human Task** Inline Standalone **Human Task** Standalone Task 2

Figure 1: Constellations

Constellations 1 and 2 show models of interaction in which tasks are defined inline as part of a BPEL process. An inline task can be defined as part of a people activity (constellation 1). In this case, the use of the task is limited to the people activity encompassing it. Alternatively, a task can be defined as a toplevel construct of the BPEL process or scope (constellation 2). In this case, the same task can be used within multiple people activities, which is significant from a reuse perspective. BPEL4People processes that use tasks in this way are portable among BPEL engines that implement BPEL4People. This also holds true for notifications.

Constellation 3 shows the use of a standalone task within the same environment, without the specification of a callable Web services interface on the task. Thus the task invocation is implementation-specific. This constellation is similar to constellation 2, except that the definition of the task is done independently of any process. As a result, the task has no direct access to process context. This also holds true for notifications.

Constellation 4 shows the use of a standalone task from a different environment. The major difference when compared to constellation 3 is that the task has a Web services callable interface, which is invoked using Web services protocols. In addition, the WS-HumanTask coordination protocol is used to communicate between processes and tasks (see section 6 "Coordinating Standalone Human Tasks" for more details on the WS-HumanTask coordination protocol). Using this mechanism, state changes are propagated between task and process activity, and the process can perform life cycle operations on the task, such as terminating it. BPEL4People processes that use tasks in this way are portable across different BPEL engines that implement BPEL4People. They are interoperable, assuming that both the process infrastructures and the task infrastructures implement the coordination protocol. In case of notifications a simplified protocol is used.

687

688

689

690 691

692

693 694 The $\begin{center} \begin{center} \begin{center}$

inputVariable: This attribute refers to a process variable which is used as input of the WSDL operation of a task or notification. The process variable in the BPEL4People Definition MUST have a WSDL message type. This attribute is optional. If this attribute is not present the
toParts> element MUST be used.

isSkipable: This attribute indicates whether the task associated with the activity can be skipped at runtime or not. This is propagated to the task level. This attribute is optional. The default for this attribute is "no".

standard-attributes: The activity makes available all BPEL's standard attributes.

standard-elements: The activity makes available all BPEL's standard elements.

 htd:task: This element is used to define an inline task within the people activity (constellation 1 in the figure above). This element is optional. Its syntax and semantics are introduced in section 4.3 "People Activities Using Local Human Tasks".

- b4p:localTask: This element is used to refer to a standalone task with no callable Web service interface (constellations 2 or 3). This element is optional. Its syntax and semantics are introduced in section 4.3 "People Activities Using Local Human Tasks"
- b4p:remoteTask: This element is used to refer to a standalone task offering callable Web service interface (constellation 4). This element is optional. Its syntax and semantics are introduced in section 4.5 "People Activities Using Remote Human Tasks".
- htd:notification: This element is used to define an inline notification within the people activity (constellation 1 in the figure above). This element is optional. Its semantics is introduced in section 4.4 "People Activities Using Local Notifications".
- b4p:localNotification: This element is used to refer to a standalone notification with no callable Web service interface (constellations 2 or 3). This element is optional. Its semantics is introduced in section 4.4 "People Activities Using Local Notifications".

b4p:remoteNotification: This element is used to refer to a standalone notification offering callable Web service interface (constellation 4). This element is optional. Its syntax and semantics are introduced in section 4.6 "People Activities Using Remote Notifications".

b4p:scheduledActions: This element specifies when the task changes its state. Its syntax and semantics are introduced in section 4.7 "Elements for Scheduled Actions".

bpel:toParts: This element is used to explicitly create multi-part WSDL message from multiple BPEL variables. The element is optional. Its syntax and semantics are introduced in the WS-BPEL 2.0 specification, section 10.3.1. The <bpel:toParts> element and the inputVariable attribute are mutually exclusive.

716 bpel: fromParts: This element is used to assign values to multiple BPEL variables from an incoming 717 multi-part WSDL message. The element is optional. Its syntax and semantics are introduced in the WS-718 attribute are mutually exclusive. This element MUST NOT be used in a BPEL4People Definition if the 719 people activity uses a notification. 720

b4p: attachmentPropagation: This element is used to describe the propagation behavior of ad-hoc 721 attachments to and from the people activity. On activation of the people activity, either all ad-hoc 722 723 attachments from the process are propagated to the people activity, so they become available to the 724 corresponding task, or none. The fromProcess attribute is used to specify this. On completion of a people activity, all ad-hoc attachments are propagated to its process, or only newly created ones (but not 725 those that were modified), or none. The toProcess attribute is used to specify this. The element is 726 optional. The default value for this element is that all attachments are propagated from the process to the 727 people activity and only new attachments are propagated back to the process.

4.2 Standard Overriding Elements

730 Certain properties of human tasks and notifications can be specified on the process level as well as on local and remote task definitions and notification definitions allowing the process to override the original 731 human task and notification definitions respectively. This increases the potential for reuse of tasks and 732 notifications. Overriding takes place upon invocation of the Web service implemented by the human task 733 (or notification) via the advanced interaction protocol implemented by both the process and the task (or 734 735 notification).

- 736 The following elements can be overridden:
- 737 people assignments
- 738 priority

695

696 697

698 699

700

701 702

703

704

705 706

707

708

709 710

711

712

713

714 715

728

- 739 People assignments can be specified on remote and local human tasks and notifications. As a
- 740 consequence, the invoked task receives the results of people queries performed by the business process
- 741 on a per generic human role base. The result will be of type torganizationalEntity. The result 742 needs to be understandable in the context of the task, i.e., the user identifiers and groups need to a)
- follow the same scheme and b) there exists a 1:1 relationship between the user identifiers and users. If a 743
- 744 generic human role is specified on both the business process and the task it calls then the people

745 assignment as determined by the process overrides what is specified on the task. In other words, the generic human roles defined at the task level provide the default. The same applies to people 746 747 assignments on remote and local notifications.

748 The task's originator is set to the process stakeholder.

Priority of tasks and notifications can be specified on remote and local human tasks and notifications. If 749 specified, it overrides the original priority of the human task (or notification). 750

Standard-overriding-elements is used in the syntax below as a shortened form of the following list of 751 752

```
<htd:priority expressionLanguage="anyURI"? >
 integer-expression
</htd:priority>
<htd:peopleAssignments>?
  <htd:genericHumanRole>
    <htd:from>...</htd:from>
  </htd:genericHumanRole>
</htd:peopleAssignments>
```

4.3 People Activities Using Local Human Tasks

People activities can be implemented using local human tasks. A local human task is one of the following:

An inline task declared within the people activity. The task can be used only by that people activity

An inline task declared within either the scope containing the people activity or the process scope. In this case the task can be reused as implementation of multiple people activities enclosed within the scope containing the task declaration

768 A standalone task identified using a QName. In this case the task can be reused across multiple BPEL4People processes within the same environment. 769

770 The syntax and semantics of people activity using local tasks is given below.

Properties

Element <htd:task> is used to define an inline task within the people activity. The syntax and semantics of the element are given in the WS-HumanTask specification. In addition, XPath expressions used in enclosed elements MAY refer to process variables. Enclosed elements MUST use the current value of the process variable. Changes to process variables MUST NOT directly cause changes in the execution of the enclosed elements, but only provide more current values when the enclosed elements choose to re-evaluate the expressions.

Element

| localTask | is used to refer to a task enclosed in the BPEL4People process (a BPEL scope or the process scope) or a standalone task provided by the same environment. Attribute

bpel4people-spec-cd-02<u>-rev-1</u> Copyright © OASIS® 2009. All Rights Reserved.

reference provides the QName of the task. The attribute is mandatory. The element MAY contain standard overriding elements explained in section 4.2 "Standard Overriding Elements".

4.4 People Activities Using Local Notifications

- 828 People activities can be implemented using local notifications. A local notification is one of the following:
- 829 An inline notification declared within the people activity. The notification can be used only by that people 830
- 831 An inline notification declared within either the scope containing the people activity or the process scope.
- 832 In this case the notification can be reused as implementation of multiple people activities enclosed within
- 833 the scope containing the notification declaration
- 834 A standalone notification identified using a QName. In this case the notification can be reused across
- multiple BPEL4People processes within the same environment. 835
- 836 The syntax and semantics of people activity using local notifications is given below.

4.4.1 Syntax

```
838
      <b4p:peopleActivity name="NCName"? inputVariable="NCName"?</pre>
839
        standard-attributes>
840
        standard-elements
841
842
        ( <htd:notification>...</htd:notification>
```

bnel4people-spec-cd-02-rev-1 Copyright © OASIS® 2009. All Rights Reserved. 6 January 20 February 2009

Properties

Element <htd:notification> is used to define an inline notification within the people activity. The syntax and semantics of the element are given in the WS-HumanTask specification. In addition, XPath expressions used in enclosed elements MAY refer to process variables. Enclosed elements MUST use the current value of the process variable. Changes to process variables MUST NOT directly cause changes in the execution of the enclosed elements, but only provide more current values when the enclosed elements choose to re-evaluate the expressions.

Element

State
Element

State
State
State
In the BPEL4People Definition (a BPEL scope or the process scope) or a standalone notification provided by the same environment. Attribute reference provides the QName of the notification. The attribute is mandatory. The element MAY contain standard overriding elements explained in section 4.2 "Standard Overriding Elements".

4.4.2 Examples

The following code shows a people activity using a standalone notification.

4.5 People Activities Using Remote Human Tasks

People activities can be implemented using remote human tasks. This variant has been referred to as constellation 4 in Figure 1. The remote human task is invoked using a mechanism similar to the BPEL invoke activity: Partner link and operation identify the human task based Web service to be called. In addition to that, the name of a response operation on the *myRole* of the partner link is specified, allowing the human task based Web service to provide its result back to the calling business process.

Constellation 4 allows interoperability between BPEL4People compliant business processes of one vendor, and WS-HumanTask compliant human tasks of another vendor. For example, the communication to propagate state changes between the business process and the remote human task happens in a standardized way, as described in section 6 "Coordinating Standalone Human Tasks".

The remote human task can also define a priority element and people assignments. The priority and people assignments specified here override the original priority of the human task.

4.5.1 Syntax

```
<b4p:remoteTask
partnerLink="NCName"
operation="NCName"
responseOperation="NCName"?>
standard-overriding-elements
```

bpel4people-spec-cd-02<u>-rev-1</u> Copyright © OASIS® 2009. All Rights Reserved. The attribute responseOperation (of type xsd:NCName) specifies the name of the operation to be used to receive the response message from the remote human task. The operation attribute refers to an operation of the myRole port type of the partner link associated with the <b4p:remoteTask>. The attribute MUST be set in the BPEL4People Definition when the operation attribute refers to a WSDL one-way operation. The attribute MUST NOT be set when the operation attribute refers to a WSDL request-response operation.

4.5.2 Example

```
901
     <bpel:extensionActivity>
902
        <b4p:peopleActivity name="prepareInauguralSpeech"</pre>
903
                            inputVariable="electionResult"
904
                            outputVariable="speech"
905
                            isSkipable="no">
          <b4p:remoteTask partnerLink="author"
906
907
                          operation="prepareSpeech"
908
                          responseOperation="receiveSpeech">
909
           <htd:priority>0</htd:priority> <!-- assign highest priority -->
910
            <htd:peopleAssignments>
911
              <htd:potentialOwners>
912
               <htd:from>$electionResult/winner</htd:from>
913
              </htd:potentialOwners>
914
            </htd:peopleAssignments>
915
          </hd>
916
        </bd></bd>
917
     </bpel:extensionActivity>
```

4.5.3 Passing Endpoint References for Callbacks

A WS-HumanTask Processor MUST send a response message back to its calling process. The endpoint to which the response is to be returned to typically becomes known as late as when the human task is instantiated. This is no problem in case the human task is invoked synchronously via a request-response operation: a corresponding session between the calling process and the human task will exist and the response message of the human task uses this session.

But if the human task is called asynchronously via a one-way operation, such a session does not exist when the response message is sent. In this case, the BPEL4People Processor MUST pass the endpoint reference of the port expecting the response message of the human task to the WS-HumanTask Processor hosting the human task. Conceptually, this endpoint reference overrides any deployment settings for the human task. Besides the address of this port that endpoint reference MUST also specify additional metadata such that the port receiving the response is able to understand that the incoming message is in fact the response for an outstanding request (see [WS-HumanTask] section 8.2 for the definition of the metadata). Finally, such an endpoint reference MUST specify identifying data to allow the response message to be targeted to the correct instance of the calling process.

The additional metadata MAY consist of the name of the port type of the port as well as binding information about how to reach the port (see [WS-Addr-Core]) in order to support the replying activity of the human task to send its response to the port. In addition, the name of the receiving operation at the calling process side is REQUIRED. This name MUST be provided as value of the responseOperation attribute of the responseOperation attribute of the responseOperation attribute of the responseOperation attribute or responseO

The above metadata represents the most generic solution allowing the response to be returned in all situations supported by WSDL. A simpler solution is supported in the case of the interaction between the calling process and the human task being based on SOAP: In this case, the metadata of the endpoint reference simply contains the value of the action header to be set in the response message.

943 In both cases (a request-response <b4p:remoteTask> as well as a <b4p:remoteTask> using two
944 one-ways) the <b4p:remoteTask> activity is blocking. That is, the normal processing of a
945 <b4p:remoteTask> activity does not end until a response message or fault message has been received
946 from the human task. If the human task experiences a non-recoverable error, the WS-HumanTask
947 Processor will signal that to the BPEL4People Processor and an b4p:nonRecoverableError fault
948 MUST be raised in the parent process.

4.6 People Activities Using Remote Notifications

As described in the previous section, people activities can also be implemented using remote notifications. This variant is also referred to as *constellation 4*. Using remote notifications is very similar to using remote human tasks. Except for the name of the element enclosed in the people activity the main difference is that the remote notification is one-way by nature, and thus does not allow the specification of a response operation.

Remote notifications, like remote human tasks allow specifying properties that override the original properties of the notification Web service. The mechanism used is the same as described above. Like remote human tasks, remote notifications also allow overriding both people assignments and priority.

4.6.1 Syntax

```
959 <bd/>
959 <br/>
960 partnerLink="NCName"<br/>
961 operation="NCName"><br/>
962 963 standard-overriding-elements<br/>
964 965 </bd>
```

4.6.2 Example

4.7 Elements for Scheduled Actions

Scheduled actions allow the specification of determining when a task needs to change its state. The following scheduled actions are defined:

DeferActivation: Specifies the activation time of the task. It is defined as either the period of time after which the task reaches state *Ready* (in case of explicit claim) or state *Reserved* (in case of implicit claim), or the point in time when the task reaches state *Ready* or state *Reserved*. The default value is zero, i.e. the task is immediately activated. If the activation time is defined as a point in time and the task is created after that point in time then the BPEL4People Processor MUST activate the task immediately.

Expiration: Specifies the expiration time of the task when the task becomes obsolete. It is defined as either the period of time after which the task expires or the point in time when the task expires. The time starts to be measured when the task enters state *Created*. If the task does not reach one of the final

bpel4people-spec-cd-02<u>-rev-1</u> Copyright © OASIS® 2009. All Rights Reserved.

6 January 20 February 2009 Page 22 of 46 states (*Completed, Failed, Error, Exited, Obsolete*) by the expiration time the BPEL4People Processor MUST change the task state to *Exited*. Additional user-defined actions MUST NOT be performed. The default value is infinity, i.e. the task never expires. If the expiration time is defined as a point in time and the task is created after that point in time the BPEL4People Processor MUST change the task state to *Exited*. Note that deferred activation does not impact expiration. Therefore the task MAY expire even before being activated.

Element

Element Element <a href="Element-shape: sc

Syntax:

```
<b4p:scheduledActions>?
  <bdd><bdp:deferActivation>?</bd>
  ( <b4p:for expressionLanguage="anyURI"?>
     duration-expression
    </bd></bd></bd></br>
  | <b4p:until expressionLanguage="anyURI"?>
    deadline-expression
    </bde>
  <br/><b4p:expiration>?
  ( <b4p:for expressionLanguage="anyURI"?>
     duration-expression
    </bd/>for>
  | <b4p:until expressionLanguage="anyURI"?>
     deadline-expression
    </bde>
  </bd></bd>
</bd></bd></ri>
```

Properties

The <b4p:scheduledActions> element has the following optional elements:

 $\mathtt{b4p:deferActivation:}$ The element is used to specify activation time of the task. It includes the following elements:

b4p:for: The element is an expression which specifies the period of time (duration) after which the task reaches state *Ready* (in case of explicit claim) or state *Reserved* (in case of implicit claim). The absolute time of this transition is computed by adding the specified duration to the time at which the people activity begins execution.

b4p:until: The element is an expression which specifies the point in time when the task reaches state *Ready* or state *Reserved*.

Elements <b4p:for> and <b4p:until> are mutually exclusive. There MUST be at least one <b4p:for> or <b4p:until> element.

b4p:expiration: The element is used to specify the expiration time of the task when the task becomes

b4p:for: The element is an expression which specifies the period of time (duration) after which the task expires. The absolute time of the expiration is computed by adding the duration to the time at which the people activity begins execution.

b4p:until: The element is an expression which specifies the point in time when the task expires.

Elements <b4p:for> and <b4p:until> are mutually exclusive. There MUST be at least one <b4p:for> or <b4p:until> element.

The language used in expressions is specified using the expressionLanguage attribute. This attribute is optional. If not specified, the default language as inherited from the closest enclosing element that specifies the attribute is used.

If specified, the scheduledActions element MUST NOT be empty, that is one of the elements b4p:deferActivation and b4p:deferActivation MUST be defined.

1069
      </bd></bd></ri>
```

4.8 People Activity Behavior and State Transitions

Figure 2 shows the different states of the people activity and state transitions with associated triggers (events and conditions) and actions to be performed when transitions take place.

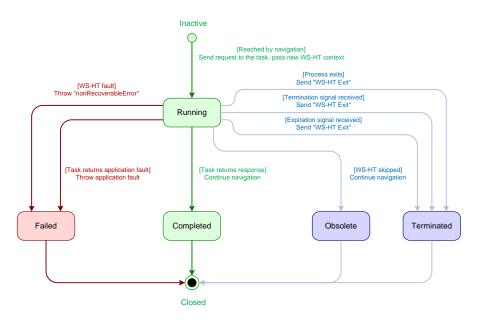

Figure 2: State diagram of the people activity

When the process execution instantiates a people activity this activity triggers the creation of a task in state *Running*. Upon receiving a response from the task, the people activity completes successfully and its state changes into the final state *Completed*.

If the task returns a fault, the people activity completes unsuccessfully and moves to final state *Failed* and the fault is thrown in the scope enclosing the people activity. If the task experiences a non-recoverable error, the people activity completes unsuccessfully and the standard fault nonRecoverableError is thrown in the enclosing scope.

The people activity goes to final state Obsolete if the task is skipped.

If the termination of the enclosed scope is triggered while the people activity is still running, the people activity is terminated prematurely and the associated running task is exited. A response for a terminated people activity MUST be ignored by the BPEL4People Processor.

If the task expires, the people activity is terminated prematurely and the associated task exits. In this case the standard fault b4p:taskExpired is thrown in the enclosing scope. When the process exits the people activity will also be terminated and the associated task is exited.

4.9 Task Instance Data

As defined by [WS-HumanTask], task instance data falls into the categories presentation data, context data, and operational data. Human tasks defined as part of a BPEL4People compliant business process have a superset of the instance data defined in [WS-HumanTask].

4.9.1 Presentation Data

The presentation data of tasks defined as part of a BPEL4People compliant business process is equivalent to that of a standalone human task.

1097	4.9.2 Context Data
1098 1099	Tasks defined as part of a BPEL4People business process not only have access to the context data of the task, but also of the surrounding business process. The process context includes
1100	Process state like variables and ad-hoc attachments
1101 1102	Values for all generic human roles of the business process, i.e. the process stakeholders, the business administrators of the process, and the process initiator
1103	Values for all generic human roles of human tasks running within the same business process
1104	4.9.3 Operational Data
1105 1106	The operational data of tasks that is defined as part of a BPEL4People compliant business process is equivalent to that of a standalone human task.

5 XPath Extension Functions

This section introduces XPath extension functions that are provided to be used within the definition of a BPEL4People business process to access process context. Definition of these XPath extension functions is provided in the table below. Input parameters that specify peopleActivity name MUST be literal strings. This restriction does not apply to other parameters. Because XPath 1.0 functions do not support returning faults, an empty node set is returned in the event of an error.

1129

Figure 3 shows some message exchanges between a BPEL process containing a people activity to perform a task (e.g. risk assessment) implemented by a remote human. The behavior of the people activity is the same as for a people activity with an inline human task. That behavior is achieved by coordinating the remote human task via the WS-HT coordination protocol.

6.1 Protocol Messages from the People Activity's Perspective

The BPEL4People Processor people activity MUST support the following behavior and the protocol messages exchanged with a standalone task. A summary is provided in the table below.

1138

When the process execution reaches a people activity and determines that this activity can be executed, the BPEL4People Processor MUST create a WS-HT coordination context associated with the activity. This context is sent together with the request message to the appropriate service associated with the task. In addition, overriding attributes from the people activity, namely priority, people assignments, the skipable indicator and the task's expiration time, are sent. Also the BPEL4People Processor MAY propagate ad-hoc attachments from the process. All this information is sent as part of the header fields of the requesting message. These header fields as well as a corresponding mapping to SOAP headers are discussed in [WS-HumanTask].

</remoteTask>

7. When the people activity is terminated, protocol message exit MUST be sent to the task. 8. When the process encounters an <exit> activity, protocol message exit MUST be sent to the task.

The following table summarizes this behavior, the protocol messages sent, and their direction, i.e., whether a message is sent from the people activity to the task ("out" in the column titled Direction) or vice

If the task does not reach one of the final states by the expiration deadline, the people activity

activity faults. The fault MUST be thrown in the scope of the people activity.

MUST be terminated. Protocol message exit is sent to the task.

the task, the people activity completes. This response MAY include all new ad-hoc attachments

When protocol message fault is received, the fault nonRecoverableError MUST be thrown in the

7 BPEL Abstract Processes

- 1157 BPEL abstract processes are indicated by the namespace "http://docs.oasis-
- 1158 open.org/wsbpe1/2.0/process/abstract". All constructs defined in BPEL4People extension
- 1159 namespaces MAY appear in abstract processes.

7.1 Hiding Syntactic Elements

- 1161 Opaque tokens defined in BPEL (activities, expressions, attributes and from-specs) MAY be used in
- 1162 BPEL4People extension constructs. The syntactic validity constraints of BPEL MUST apply in the same
- 1163 way to an Executable Completion of an abstract process containing BPEL4People extensions.

1164 **7.1.1 Opaque Activities**

- 1165 BPEL4people does not change the way opaque activities can be replaced by an executable activity in an
- 1166 executable completion of an abstract process, that is, an < bpelabstract:opaqueActivity> MAY
- also serve as a placeholder for a

 sextensionActivity> containing a
- 1168 <b4p:peopleActivity>.

1169 **7.1.2 Opaque Expressions**

- 1170 Any expression introduced by BPEL4People MAY be made opaque. In particular, the following
- 1171 expressions MAY have the opaque="yes" attribute:
- 1172 <htd:argument name="NCName" expressionLanguage="anyURI"? opaque="yes" />
- 1173 <htd:priority expressionLanguage="anyURI" opaque="yes" />
- 1174 <b4p:for expressionLanguage="anyURI"? opaque="yes" />
- 1175 <b4p:until expressionLanguage="anyURI"? opaque="yes" />

1176 **7.1.3 Opaque Attributes**

- 1177 Any attribute introduced by BPEL4People MAY have an opaque value "##opaque" in an abstract
- 1178 process.

1179

1156

1160

7.1.4 Opaque From-Spec

- 1180 In BPEL, any from-spec in an executable process can be replaced by an opaque from-spec
- 1182 BPEL4People b4p:logicalPeopleGroup="NCName" attribute. In addition, the extension from-spec
- 1183 <htd:from> MAY also be replaced by an opaque from-spec in an abstract process.

1184 **7.1.5 Omission**

- 1185 In BPEL, omittable tokens are all attributes, activities, expressions and from-specs which are both (1)
- 1186 syntactically required by the Executable BPEL XML Schema, and (2) have no default value. This rule also
- applies to BPEL4People extensions in abstract processes. For example, <b4p:localTask
- 1188 reference="##opaque"> is equivalent to <b4p:localTask>.

1189 7.2 Abstract Process Profile for Observable Behavior

- 1190 The Abstract Process Profile for Observable Behavior, indicated by the process attribute
- 1191 abstractProcessProfile="http://docs.oasis-
- 1192 open.org/wsbpe1/2.0/process/abstract/ap11/2006/08", provides a means to create precise
- and predictable descriptions of observable behavior of the service(s) provided by an executable process.

follow the same interactions as the abstract process, with the partners that are specified by the process. The executable process canmay, however, perform additional interaction steps rela partners. Likewise, the executable process canmay perform additional human interactions. B restrictions defined in WS-BPEL 2.0, the use of opacity is not restricted in any way for elementations at the partners that are specified by the process. The executable process, with the partners that are specified by the process. The executable process, with the partners that are specified by the process. The executable process, with the partners that are specified by the process. The executable process, with the partners that are specified by the process. A. Standard Faults

1258

1259 1260 The following list specifies the standard faults defined within the BPEL4People specification. All standard fault names are qualified with the standard BPEL4People namespace.

Fault name	Description
nonRecoverableError	Thrown if the task experiences a non-recoverable error.
taskExpired	Thrown if the task expired.

B. Portability and Interoperability Considerations

The following section illustrates the portability and interoperability aspects of the various usage constellations of BPEL4People with WS-HumanTask as described in Figure 1:

Portability - The ability to take design-time artifacts created in one vendor's environment and use them in another vendor's environment. Constellations one and two provide portability of BPEL4People processes with embedded human interactions in. Constellations three and four provide portability of BPEL4People processes with referenced human interactions.

Interoperability - The capability for multiple components (process engine, task engine and task list client) to interact using well-defined messages and protocols. This enables to combine components from different vendors allowing seamless execution.

Constellation four achieves interoperability between process and tasks from different vendor

1273 Con:

implementations.

1276 Constellation 1

Task definitions are defined inline of the people activities. Usage in this manner is typically for self-contained people activities, whose tasks definitions are not intended to be reused elsewhere in the process or across multiple processes. This format will also provide scoping of the task definition since it will not be visible or accessible outside the people activity in which it is contained. Portability for this constellation requires support of both WS-HumanTask and BPEL4People artifacts using the inline task definition format. Since the process and task interactions are combined in one component, interoperability requirements are limited to those between the task list client and the infrastructure.

1285 Constellation 2

Similar to constellation 1, but tasks are defined at the process level. This allows task definitions to be referenced from within people activities enabling task reuse. Portability for this constellation requires support of both WS-HumanTask and BPEL4People artifacts using the process level scoped task definition format. Since the process and task interactions are combined in one component, interoperability requirements are limited to those between the task list client and the infrastructure.

Constellation 3

In this constellation, the task and people activity definitions are defined as separate artifacts and execute in different infrastructure components but provided by the same vendor. Portability for this constellation requires support of both WS-HumanTask and BPEL4People as separate artifacts. Since the process and task components are implemented by the same vendor, interoperability requirements are limited to those between the task list client and the infrastructure.

1299 Constellation 4

Identical to constellation 3 in terms of the task and people activity definitions, but in this case the process
 and task infrastructure are provided by different vendors. Portability for this constellation requires support
 of both WS-HumanTask and BPEL4People as separate artifacts. Interoperability between task and
 process infrastructures from different vendors is achieved using the WS-HumanTask coordination
 protocol.

C. BPEL4People Schema

Note to specification editors: the BPEL4People XML Schema definition is separately maintained in an 1306 1307 artifact

1308

1305

1309 The contents of this artifact shall be copied back into this section before publishing the specification, e.g.,

1310 as a committee draft.

D. Sample

1317 1318

1319

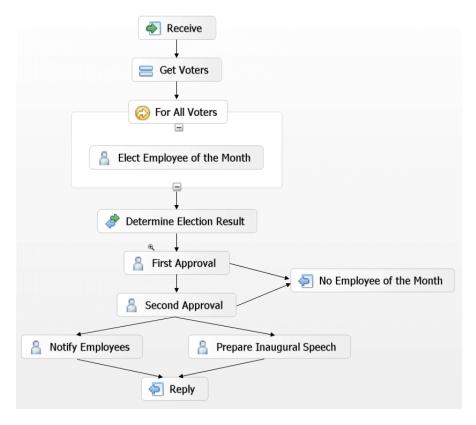

1320 1321

1322 1323

1324

1325

This appendix contains a sample that outlines the basic concepts of this specification. The sample process implements the election of the "Employee of the month" in a fictious company. The structure of the business process is shown in the figure below:

The process is started and as a first step, the people are determined that qualify as voters for the "Employee of the month". Next, all the voters identified before get a chance to cast their votes. After that, the election result is determined by counting the votes casted. After the result is clear, two different people from the set of people entitled to approve the election either accept or reject the voting result. In case any of the two rejects, then there is no "Employee of the month" elected in the given month, and the process ends. In case all approvals are obtained successfully, the employees are notified about the outcome of the election, and a to-do is created for the elected "Employee of the month" to prepare an inaugural speech. Once this is completed, the process completes successfully.

The sections below show the definition of the BPEL process implementing the "Employee of the month" process.

1326	D.1 BPEL Definition
1327 1328	Note to specification editors: the BPEL4People example process definition is separately maintained in an artifact
1329	bpel4people-example-employee-of-the-month.bpel
1330 1331	The contents of this artifact shall be copied back into this section before publishing the specification, e.g., as a committee draft.
1332	D.2 WSDL Definitions
1333 1334	Note to specification editors: the BPEL4People example WSDL definitions are separately maintained in artifacts
1335	bpel4people-example-election.wsdl
1336	bpel4people-example-approval.wsdl
1337 1338	The contents of this artifact shall be copied back into this section before publishing the specification, e.g., as a committee draft.

G. Revision History

[optional; should not be included in OASIS Standards] 1414

1415

1413

	Revision	Date	Editor	Changes Made
	WD-01	2008-03-12	Dieter König	First working draft created from submitted specification
	WD-02	2008-03-13	Dieter König	Added specification editors Moved WSDL and XSD into separate artifacts
	WD-02	2008-06-25	Ivana Trickovic	Resolution of Issue #8 incorporated into the document/section 5
	WD-02	2008-06-28	Dieter König	Resolution of Issue #13 applied to complete document and all separate XML artifacts
	WD-02	2008-06-28	Dieter König	Resolution of Issue #21 applied to section 2
				Resolution of Issue #22 applied to sections 2.4.1 and 3.1.1
	WD-02	2008-07-06	Vinkesh Mehta	Resolution for Issue #3 applied to sections 2.4.1 (~line 353)
	WD-02	2008-07-25	Krasimir Nedkov	Resolution for Issue #18 applied to sections 4.6.2 and 5; Typos correction.
	WD-02	2008-07-29	Ralf Mueller	Resolution for Issue #11 applied to section 3.1.2
	WD-02	2008-07-29	Luc Clément	Resolution for Issue #10 applied to first paragraph of section 3.3
	CD-01-rev-1	2008-10-02	Ralf Mueller	Resolution for Issue #17 and #24 applied to section 2 and 5
	CD-01-rev-2	2008-10-07	Michael Rowley	Resolution for Issue #2 applied in section 4.7, and for issue #19 in sections 4.3.1 and 4.4.1.
	CD-01-rev-3	2008-10-20	Dieter König	Resolution for Issue #23 applied to section 3.2.1
				Resolution of Issue #6 applied to section 5
	CD-01-rev-3	2008-10-20	Vinkesh Mehta	Resolution of issue-12, section 3.2.2, 4.2 font changed to italics for htd:genericHumanRole. Also mofified XML artifacts for boel4people.xsd, humantask.xsd, humantask-context.xsd
	CD-01-rev-3	2008-12-03	Ralf Mueller	Resolution for Issue #16 applied to sections 1 – 6

Formatted Table

	CD-01-rev-3	2008-12-12	Ravi Rangaswamy	Resolution for Issue #16 applied to sections 7 and appendix B
l	CD-01-rev-3	2008-12-18	Ravi Rangaswamy	Resolution for Issue #16: Undid changes to appendix B
	CD-01-rev-4	2008-12-19	Ralf Mueller	Incorporated review comments from Ivana and Luc for Issue BP-16
	<u>CD-02</u>	2009-01-18	Luc Clément	Committee Draft 2
	CD-02-rev-1	2009-02-20	Dieter König	Issue 47: added getState() in section 5 Issue 48: abstract BPEL ns in 7.1.1 Issue 50, sections 3 and 5 (htd:→htt:)
	CD-02-rev-2	2009-03-11	Ralf Mueller	Issue 76: Changes for RFC2119
