2	Editor support so far my biggest blocker to using MDITA. Particularly validation of embedded HDITA elements.
3	The domain choices for the different formats should be options, not radios. I would have chosen Dev and Prod docs for all questions. I implemented a DITA-to-HTML transform-in-the-browser system. I uses a DITA subset similar to LwDITA... Would have used LwDITA but it wasn't available when we were laying that groundwork. Would use it today... EXCEPT we need more than simple tables. Sort of simple tables plus. We need straddle cells.
5	Focus on finalizing the MDITA spec before expanding the scope to additional formats or use cases that would further delay the release. Remember this was supposed to be "lightweight" DITA: specialization is not lightweight.
7	You really need to rework this survey with more information and context.
