24 **Status of this Document**

25 This note describes the initial proposal for the Iteration Support in Queries
26 work item for OASIS ebXML Registry V3.0. It is expected that the Query sub-team of
27 the OASIS ebXML Registry TC will improve upon this initial proposal and then submit it
28 for consideration by ebXML Registry TC at large.

29 **1 Abstract**

30 This document proposes a minor enhancement to existing query capabilities feature of the
31 OASIS ebXML Registry targeted for version 3.0. The `Iteration Support in`
32 `Queries` enables the registry to handle queries that match very large results sets in a
33 scalable manner. The feature enables the large result set to be broken-down into smaller
34 chunks and retrieved in multiple queries.

35 **2 Motivation**

36 The following motivations drive this proposal:

- 37
- 38 1. Enable large-scale registries.
 - 39 2. Gracefully handle queries that are not specific enough.
- 40

41 **3 Assumptions**

42 The following assumptions are made in this proposal:

- 43 1. Feature will be enabled in a backward compatible manner.

44 **4 External Dependencies**

45 This proposal depends upon the following external artifacts and event:

- 46
 - o No external dependencies

47 **5 Use Cases**

48 There are many scenarios where the iteration support within queries is necessary.

49 **5.1 Query Is Too Broad**

50 An user may submit a query that is not specific enough and matches a result set that is too
51 large. This can be the case of a naïve user. It may also be the case of a malicious user
52 engaged in a Denial of Service (DOS) attack.

53 **5.2 Result Set Too Large**

54 A registry may be of a very large scale and have very large result sets that match
55 reasonable queries.

56 **6 Changes To ebRS**

57 [Note]The following section will replace section 8.1
58 in ebRS. Note that there are some formatting
59 changes (syntax, parameters, returns,
60 exceptions) that are there for improved
61 clarity. The format changes have been
62 influenced by the recently released UDDI V3
63 specs. Finally note the only change to XML
64 Schema is the introduction of `startIndex`,

65 maxResults to AdhocQueryRequest, and the
66 introduction of startIndex and totalResultCount
67 in AdhocQueryResponse.

68

69 6.1 Ad Hoc Query Request/Response

70 A client submits an ad hoc query to the QueryManager by sending an
71 AdhocQueryRequest. The AdhocQueryRequest contains a subelement that defines a
72 query in one of the supported Registry query mechanisms.

73 The QueryManager sends an AdhocQueryResponse either synchronously or
74 asynchronously back to the client. The AdhocQueryResponse returns a collection of
75 objects whose element type depends upon the responseOption attribute of the
76 AdhocQueryRequest. These may be objects representing leaf classes in [eBRIM],
77 references to objects in the registry as well as intermediate classes in [eBRIM] such as
78 RegistryObject and RegistryEntry.

79 Any errors in the query request messages are indicated in the corresponding query
80 response message.

81

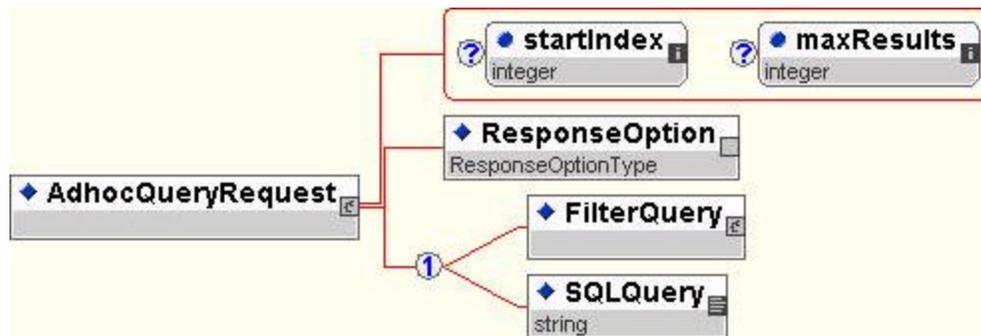

82 Figure 1: Submit Ad Hoc Query Sequence Diagram

83 For details on the schema for the business documents shown in this process refer to
84 Appendix **Error! Reference source not found.**

85 6.1.1 AdhocQueryRequest

86 The AdhocQueryRequest is used to submit queries to the registry.

87 **6.1.1.1 Syntax:**

88
89

Figure 2: AdhocQueryRequest Syntax

90 **6.1.1.2 Parameters:**

- 91 *FilterQuery*: This parameter specifies a registry Filter Query.
- 92 *maxResults*: This optional parameter specifies a limit on the maximum
93 number of results (that are instances of the specified return type), the
94 client wishes the query to return. If unspecified, the registry should return
95 either all the results, or in case the result set size exceeds an registry
96 operator specific limit, the registry should return a sub-set of results that
97 are within the bounds of the registry operator specific limit.
- 98 *ResponseOption*: This required parameter allows the client to control the
99 format and content of the AdhocQueryResponse to this request. See
100 section 6.1.3 for details.
- 101 *SQLQuery*: This parameter specifies a registry SQL Query.
- 102 *startIndex*: This optional integer value is used to indicate which result set
103 SHOULD be returned first results set when iterating over a large result set.
104 The default value is 0, which returns result sets starting with index 0 (first
105 result set).

106
107

108 **6.1.1.3 Returns:**

109 This request returns an AdhocQueryResponse upon success. See section 6.1.2 for details.

110 **6.1.1.4 Exceptions:**

111 In addition to the exceptions common to all requests, the following exceptions may be
112 returned:

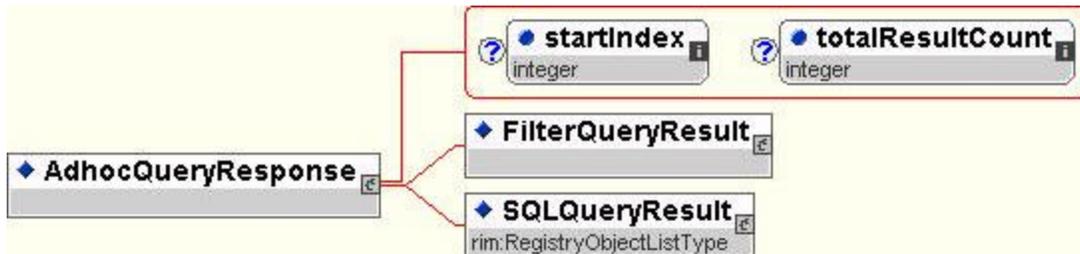

- 113 *InvalidQueryException*: signifies that the query syntax was invalid. Client
114 must fix the query syntax and re-submit the query.

115 **6.1.2 AdhocQueryResponse**

116 The AdhocQueryRequest sent by the registry as a response to AdhocQueryRequest.

117

118 **6.1.2.1 Syntax:**

119

120

Figure 3: AdhocQueryResponse Syntax

121 **6.1.2.2 Parameters:**

122 *FilterQueryResult*: This parameter specifies the result of a registry Filter
123 Query.

124 *SQLQueryResult*: This parameter specifies the result of a registry SQL
125 Query.

126 *startIndex*: This optional integer value is used to indicate the index for the
127 first result in the result set returned by the query, within the complete
128 result set matching the query within the registry. By default, this value is 0.

129 *totalResultCount*: This optional parameter specifies the size of the
130 complete result set matching the query within the registry. When this
131 value is unspecified, the client should assume that value is the size of the
132 result set contained within the result.

133

134 **6.1.3 ReponseOption**

135 A client specifies an ResponseOption structure within an AdhocQueryRequest to indicate
136 the format of the results within the corresponding AdhocQueryResponse.

137

138 **6.1.3.1 Syntax:**

139

140

Figure 4: ResponseOption Syntax

141

142 **6.1.3.2 Parameters:**

143 *returnComposedObjects*: This optional parameter specifies whether the
144 RegistryObjects returned should include composed objects such as
145 Classifications, ExternalIdentifiers etc. The default is to return all
146 composed objects.

147 *returnType*: This optional enumeration parameter specifies the type of
148 RegistryObject to return within the response. Enumeration values for
149 returnType are explained in section 6.1.3.3.

150

151 **6.1.3.3 Enumeration returnType**

152 Enumeration values for returnType are as follows:

153 ?? ObjectRef - This option specifies that the AdhocQueryResponse may contain a
154 collection of ObjectRef XML elements as defined in [ebRIM Schema]. Purpose of
155 this option is to return just the identifiers of the registry objects.

156 ?? RegistryObject - This option specifies that the AdhocQueryResponse may contain a
157 collection of RegistryObject XML elements as defined in [ebRIM Schema]. In this
158 case all attributes of the registry objects are returned (objectType, name, description,
159 ...) in addition to id attribute.

160 ?? RegistryEntry - This option specifies that the AdhocQueryResponse may contain a
161 collection of RegistryEntry or RegistryObject XML elements as defined in [ebRIM
162 Schema], which correspond to RegistryEntry or RegistryObject attributes.

163 ?? LeafClass - This option specifies that the AdhocQueryResponse may contain a
164 collection of XML elements that correspond to leaf classes as defined in [ebRIM
165 Schema].

166 ?? LeafClassWithRepositoryItem - This option specifies that the AdhocQueryResponse
167 may contain a collection of ExtrinsicObject XML elements as defined in [ebRIM
168 Schema] accompanied with their repository items or RegistryEntry or RegistryObject
169 and their attributes. Linking of ExtrinsicObject and its repository item is
170 accomplished using the technique explained in Section **Error! Reference source not
171 found. -Error! Reference source not found..**

172 If “returnType” is higher then the RegistryObject option, then the highest option that
173 satisfies the query is returned. This can be illustrated with a case when

174 OrganizationQuery is asked to return LeafClassWithRepositoryItem. As this is not
175 possible, QueryManager will assume LeafClass option instead. If OrganizationQuery is
176 asked to retrieve a RegistryEntry as a return type then RegistryObject metadata will be
177 returned.

178 **6.1.4 Iterative Query Support**

179 The AdhocQueryRequest and AdhocQueryResponse support the ability to iterate over a
180 large result set matching a logical query by allowing multiple AdhocQueryRequest
181 requests to be submitted such that each query requests a different sliding window within
182 the result set. This feature enables the registry to handle queries that match a very large
183 result set, in a scalable manner.

184 The iterative queries feature is not a true Cursor capability as found in databases. The
185 registry is not required to maintain transactional consistency or state between iterations of
186 a query. Thus it is possible for new objects to be added or existing objects to be removed
187 from the complete result set in between iterations. As a consequence it is possible to have
188 a result set element be skipped or duplicated between iterations.

189 Note that while it is not required, it may be possible for implementations to be smart and
190 implement a transactionally consistent iterative query feature. It is likely that a future
191 version of this specification will require a transactionally consistent iterative query
192 capability.

193 **6.1.4.1 Query Iteration Example**

194 Consider the case where there are 1007 Organizations in a registry. The user wishes to
195 submit a query that matches all 1007 Organizations. The user wishes to do the query
196 iteratively such that Organizations are retrieved in chunks of 100. The following table
197 illustrates the parameters of the AdhocQueryRequest and those of the
198 AdhocQueryResponses for each iterative query in this example.

199

AdhocQueryRequest Parameters		AdhocQueryResponse Parameters		
startIndex	maxResults	startIndex	totalResultCount	# of Results
0	100	0	1007	100
100	100	100	1007	100
200	100	200	1007	100
300	100	300	1007	100
400	100	400	1007	100
500	100	500	1007	100
600	100	600	1007	100
700	100	700	1007	100
800	100	800	1007	100
900	100	900	1007	100
1000	100	1000	1007	7
