Proposal sent to list by Mike Edwards:

<http://lists.oasis-open.org/archives/sca-assembly/200712/msg00012.html>

Following changes to the proposal text were debated and agreed:

1. "Where the reference has a value specified in its @target attribute, all the binding types identified by the child binding elements MAY be used on each wire created by the @target attribute."

replaced by:

"Where the reference has a value specified in its @target attribute, one of the child binding elements MUST be used on each wire created by the @target attribute, or the sca binding, if no binding is specified."

2. "Where it is detected the the above rules have been violated, either at deployment or at execution time, an SCA Runtime MUST generate an error before the reference is invoked by the component implementation."

replaced by:

"Where it is detected that the above rules have been violated, either at deployment or at execution time, an SCA Runtime MUST generate an error no later than when the reference is invoked by the component implementation."

3. "In these cases, the SCA runtime MUST generate an error before the reference is invoked by the component implementation."

replaced by:

"In these cases, the SCA runtime MUST generate an error no later than when the reference is invoked by the component implementation."

4. In the paragraph:

"For the binding of a reference, the uri attribute defines the target URI of the reference. This MAY be either the componentName/serviceName for a wire to an endpoint within the SCA domain, or the accessible address of some service endpoint either inside or outside the SCA domain (where the addressing scheme is defined by the type of the binding)."

...replace the word MAY with MUST

Mike Edwards moves to accept the proposal with the changes identified on this call  
Simon Nash seconds.
