Abstract:

The SCA Web Service binding specified in this document applies to the services and references of an SCA composites. It defines the manner in which a service can be made available as a web service, and in which a reference can invoke a web service.

This binding is a WSDL-based binding; that means it either references an existing WSDL binding or allows one to specify enough information to generate one. When an existing WSDL binding is not referenced, rules defined in this document allow one to generate a WSDL binding.

Status:

This document was last revised or approved by the OASIS Service Component Architecture / Bindings (SCA-Bindings) TC on the above date. The level of approval is also listed above. Check the “Latest Version” or “Latest Approved Version” location noted above for possible later revisions of this document.

Technical Committee members should send comments on this specification to the Technical Committee’s email list. Others should send comments to the Technical Committee by using the “Send A Comment” button on the Technical Committee’s web page at http://www.oasis-open.org/committees/sca-bindings/.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (http://www.oasis-open.org/committees/sca-bindings/ipr.php.

The non-normative errata page for this specification is located at http://www.oasis-open.org/committees/sca-bindings/.

Notices

All capitalized terms in the following text have the meanings assigned to them in the OASIS Intellectual Property Rights Policy (the "OASIS IPR Policy"). The full Policy may be found at the OASIS website.

This document and translations of it may be copied and furnished to others, and derivative works that comment on or otherwise explain it or assist in its implementation may be prepared, copied, published, and distributed, in whole or in part, without restriction of any kind, provided that the above copyright notice and this section are included on all such copies and derivative works. However, this document itself may not be modified in any way, including by removing the copyright notice or references to OASIS, except as needed for the purpose of developing any document or deliverable produced by an OASIS Technical Committee (in which case the rules applicable to copyrights, as set forth in the OASIS IPR Policy, must be followed) or as required to translate it into languages other than English.

The limited permissions granted above are perpetual and will not be revoked by OASIS or its successors or assigns.

This document and the information contained herein is provided on an "AS IS" basis and OASIS DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY OWNERSHIP RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

OASIS requests that any OASIS Party or any other party that believes it has patent claims that would necessarily be infringed by implementations of this OASIS Committee Specification or OASIS Standard, to notify OASIS TC Administrator and provide an indication of its willingness to grant patent licenses to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification.

OASIS invites any party to contact the OASIS TC Administrator if it is aware of a claim of ownership of any patent claims that would necessarily be infringed by implementations of this specification by a patent holder that is not willing to provide a license to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification. OASIS may include such claims on its website, but disclaims any obligation to do so.

OASIS takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on OASIS' procedures with respect to rights in any document or deliverable produced by an OASIS Technical Committee can be found on the OASIS website. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this OASIS Committee Specification or OASIS Standard, can be obtained from the OASIS TC Administrator. OASIS makes no representation that any information or list of intellectual property rights will at any time be complete, or that any claims in such list are, in fact, Essential Claims.

The names "OASIS" is a trademark of OASIS, the owner and developer of this specification, and should be used only to refer to the organization and its official outputs. OASIS welcomes reference to, and implementation and use of, specifications, while reserving the right to enforce its marks against misleading uses. Please see http://www.oasis-open.org/who/trademark.php for above guidance.

Table of Contents

1 Introduction

The SCA Web Service binding specified in this document applies to the services and references of composites and components [SCA-Assembly]. It defines the manner in which a service can be made available as a web service, and in which a reference can invoke a web service.

This binding is a WSDL-based binding; that means it either references an existing WSDL binding or can be configured to specify enough information to generate one. When an existing WSDL binding is not referenced, rules defined in this document allow one to generate a WSDL binding.

The Web Service binding can point to an existing WSDL [WSDL] document, separately authored, that specifies the details of the WSDL binding to be used to provide or invoke the web service. In this case the SCA web services binding allows anything that is valid in a WSDL binding, including rpc-encoded style and binding extensions. It is the responsibility of the SCA system provider to ensure support for all options specified in the WSDL binding. Interoperation of such services is not guaranteed.

The SCA Web Service binding also provides attributes that can be used to provide the details of a WSDL SOAP binding. This allows a WSDL document to be synthesized in the case that one does not already exist. In this case only WS-I compliant mapping is supported.

The SCA Web Service binding can be further customized through the use of SCA Policy Sets. For example, a requirement to conform to a WS-I profile [WSI-Profiles] could be represented with a policy set.

1.1 Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [HYPERLINK \l "_Toc223754343"D. Non-Normative Text 20].

This specification uses predefined namespace prefixes throughout; they are given in the following list. Note that the choice of any namespace prefix is arbitrary and not semantically significant.

Table 1-1 Prefixes and Namespaces used in this specification

Prefix	***Namespace***	***Notes***
xs	"http://www.w3.org/2001/XMLSchema"	Defined by XML Schema 1.0 specification
wsa	"http://www.w3.org/2005/08/addressing"	Defined by WS-Addressing 1.0
wsp	"http://www.w3.org/ns/ws-policy"	Defined by WS-Policy 1.5
wsrmp	"http://docs.oasis-open.org/ws-rx/wsrmp/200702"	Defined by WS-ReliableMessaging Policy 1.2
soap11	"http://schemas.xmlsoap.org/soap/envelope/"	Defined by SOAP 1.1
soap12	"http://www.w3.org/2005/08/addressing"	Defined by SOAP 1.2

wsdli	"http://www.w3.org/ns/wsdl-instance"	Defined by WSDL 2.0
sca	"http://docs.oasis-open.org/ns/opencsa/sca/200712"	Defined by the SCA specifications

2 Web Service Binding Schema

The Web Service binding element is defined by the following pseudo-schema.

```
<binding.ws name="xs:NCName"?
            requires="list of xs:QName"?
            policySets="list of xs:QName"?
            uri="xs:anyURI"?
            wsdlElement="xs:anyURI"?
            wsdli:wsdlLocation="list of xs:anyURI pairs"?
            ...>
   <wireFormat/>?
   <operationSelector/>?
   <endpointReference>...</endpointReference>*
   ...
</binding.ws>
```

- ***/binding.ws/@name*** - as defined in the SCA Assembly Specification [SCA-Assembly].
- ***/binding.ws/@requires*** - as defined in the SCA Assembly Specification [SCA-Assembly].
- ***/binding.ws/@policySets*** - as defined in the SCA Assembly Specification [SCA-Assembly].
- ***/binding.ws/@uri*** - the resolution algorithm of Section 2.1 below describes how this attribute is interpreted.
- ***/binding.ws/@wsdlElement*** – when present this attribute specifies the URI of a WSDL element. This attribute points to the specified element in an existing WSDL document. The URI can have the following forms:
  - Service:

    <WSDL-namespace-URI>#wsdl.service(<service-name>)

    In this case, the SCA runtime MUST make all the ports in the WSDL Service that have equivalent portTypes with the SCA service or reference available to the SCA service or reference.
  - Port (WSDL 1.1):

    <WSDL-namespace-URI>#wsdl.port(<service-name>/<port-name>)

    In this case, the port in the WSDL 1.1 Service identified by the <binding.ws> element MUST implement a portType that is equivalent to the one specified for the SCA service or reference. The identified port MUST be made available to the SCA service or reference by the SCA runtime.
  - Endpoint (WSDL 2.0):

    <WSDL-namespace-URI>#wsdl.endpoint(<service-name>/<endpoint-name>)

    In this case, the endpoint in the WSDL 2.0 Service identified by the <binding.ws> element MUST have an equivalent portType with the SCA service or reference. The identified endpoint MUST be made available to the SCA service or reference by the SCA runtime.

- Binding:

  <WSDL-namespace-URI>#wsdl.binding(<binding-name>)

  In this case, the WSDL binding identified by the <binding.ws> element MUST implement a portType that is equivalent to the one specified for the SCA service or reference. The SCA runtime MUST make the service or reference available via the specified WSDL binding. In this case, the endpoint address URI for an SCA reference MUST be specified by either the *@uri* attribute on the binding or a WS-Addressing *EndpointReference* element, except where the SCA Assembly specification states that the *@uri* attribute can be omitted. The endpoint address URI for an SCA service or the callback element of an SCA reference is determined as specified in section 2.1. For the *callback* element of an SCA service, the binding MUST NOT specify an endpoint address URI or a WS-Addressing EndpointReference..

- ***/binding.ws/@wsdli:wsdlLocation*** – when present this attribute specifies the location(s) of the WSDL document(s) associated with specific namespace(s). This attribute MAY be specified by the binding in the event that the <WSDL-namespace-URI> in the 'endpoint' attribute is not dereferencable, or when the intended WSDL document is to be found at a different location than the one pointed to by the <WSDL-namespace-URI>. The use of this attribute indicates that the WSDL binding points to an existing WSDL document. The semantics of this attribute are specified in Section 7.1 of WSDL 2.0 [WSDL].
- ***/binding.ws/wireFormat*** – as defined in the SCA Assembly Specification [**SCA-Assembly**]. This specification does not define any new wireFormat elements.
- ***/binding.ws/operationSelector*** – as defined in the SCA Assembly Specification [SCA-Assembly]. This specification does not define any new operationSelector elements.
- ***/binding.ws/endpointReference*** – when present this element provides the WS-Addressing [WS-Addr] EndpointReference that specifies the endpoint for the service or reference. When this element is present along with the *@wsdlElement* attribute on the parent element, the *@wsdlElement* attribute value MUST be of the 'Binding' form as specified above, i.e. <WSDL-namespace-URI>#wsdl.binding(<binding-name>).
- ***/binding.ws/@{any}*** - this is an extensibility mechanism to allow extensibility via attributes.
- ***/binding.ws/any*** – this is an extensibility mechanism to allow extensibility via elements.

2.1 Endpoint URI resolution

The rules for resolving the URI at which an SCA service is hosted, or SCA reference targets, when used with binding.ws (in precedence order) are:

1. The URIs in the endpoint(s) of the referenced WSDL
   or
   The URI specified by the *wsa:Address* element of the e*ndpointReference*,
2. The explicitly stated URI in the *@uri* attribute of the *binding.ws* element, which can be relative,
3. The structural URI as defined by the Assembly specification

An SCA runtime MUST follow rules listed above in determining the URI at which an SCA service is hosted or an SCA reference is targeted.

The URI in the WSDL endpoint or in the *wsa:Address* of an EPR MAY be a relative URI, in which case it is relative to the URI defined in (2) or (3). The *wsa:Address* element MAY be the empty relative URI, in which case it uses the URI defined in (2) or (3) directly. This enables the EPR writer to specify reference parameters, metadata and other EPR contents while letting the deployer choose the URI.

To reference a WSDL document and also specify an EPR, the *@wsdlElement* attribute MUST refer to a binding element in the WSDL.

2.2 Interface mapping

When *binding.ws* is used on a service or reference with an interface that is not defined by *interface.wsdl*, then a WSDL portType for the service or reference is derived from the interface by the rules defined for that SCA interface type. An SCA runtime MUST raise an error if the interface does not map to a WSDL portType.

For example, for *interface.java*, the mapping to a WSDL portType is as defined in the SCA Java Common Annotations and API Specification [SCA-JCAA].

binding.ws implementations can use appropriate standards, for example WS-I AP 1.0 [WSI-AP] or MTOM [MTOM], to map interface parameters to binary attachments transparently to the target component.

2.3 Production of WSDL description for an SCA service

Any service hosted by an SCA runtime with one or more web service bindings with HTTP endpoints SHOULD return a WSDL description of the service in response to an HTTP GET request with the "?wsdl" suffix to that HTTP endpoint. If none of the web service bindings have HTTP endpoints, then some other means of obtaining the WSDL description of the service SHOULD be provided by the SCA runtime. This can include out of band mechanisms, for example publication to a UDDI registry.

Refer to section for a detailed definition of the rules that SHOULD be used for generating the WSDL description of an SCA service with one or more web service bindings.

2.4 Additional binding configuration data

SCA runtime implementations MAY provide additional metadata that is associated with a web service binding, for example to enable JAX-WS [JAX-WS] handlers to be executed as part of the target component dispatch. The specification of such metadata is SCA runtime-specific and is outside of the scope of this document.

2.5 Web Service Binding and SOAP Intermediaries

The Web Service binding does not provide any direct or explicit support for SOAP intermediaries [SOAP].

2.6 Support for WSDL extensibility

When a binding.ws element uses the @wsdlElement attribute, the details of the binding are specified by the WSDL element referenced by the value of the attribute. Per the WSDL specification, WSDL allows for extensibility via elements as well as attributes, and it specifies rules for processing such elements. This specification does not constrain the use of such extensibility in WSDL and relies on the rules specified in the WSDL specification for processing such extended elements.

This specification requires that an SCA runtime MUST support the WSDL extensions defined in the namespace associated with the prefix "sca" (as defined in section 1.1).

Because a WSDL document might contain extension elements that cannot be supported by the SCA runtime, when using the @wsdlElement form of binding.ws it is not possible to determine whether the binding is supported by the SCA runtime without parsing the referenced WSDL element and its dependent elements.

2.7 Intents listed in the bindingType

This specification places no requirements on the intents that are listed as either *@alwaysProvides* or *@mayProvides* in the bindingType for *binding.ws*.

2.8 Intents and binding configuration

The SCA runtime MUST raise an error if the web service binding is configured with a policy intent(s) that conflicts with a binding instance's configuration. For example, it is an error to use the SOAP policy intent in combination with a WSDL binding that does not use SOAP.

3 Web Service Binding Examples

The following snippets show the sca.composite file for the MyValueComposite file containing the service element for the MyValueService and reference element for the StockQuoteService. Both the service and the reference use a Web Service binding.

3.1 Example Using WSDL documents

This example shows a service and reference using the SCA Web Service binding, using existing WSDL documents in both cases. In each case there is a single binding element, whose name defaults to the service/reference name.

The service’s binding is defined by the WSDL document associated with the given URI. This service conforms to WS-I Basic Profile 1.1.

The reference’s first binding is defined by the specified WSDL service in the WSDL document at the given location. The reference can use any of the WSDL service’s ports/ endpoints to invoke the target service. The reference’s second binding is defined by the specified WSDL binding. The specific endpoint URI to be invoked is provided via the *@uri* attribute.

```
<?xml version="1.0" encoding="ASCII"?>
<composite xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200712"
           name="MyValueComposite">
   <service name="MyValueService">
      <interface.java interface="services.myvalue.MyValueService"/>
      <binding.ws wdslElement="http://www.example.org/MyValueService#
                              wsdl.endpoint(MyValueService/MyValueServiceSOAP
)"/>
         ...
   </service>

   ...

   <reference name="StockQuoteReference1">
      <interface.java interface="services.stockquote.StockQuoteService"/>
      <binding.ws wsdlElement="http://www.example.org/StockQuoteService#
                              wsdl.service(StockQuoteService)"
      wsdli:wsdlLocation="http://www.example.org/StockQuoteService
                         http://www.example.org/StockQuoteService.wsdl"/>
   </reference>

   <reference name="StockQuoteReference2">
      <interface.java interface="services.stockquote.StockQuoteService"/>
      <binding.ws wsdlElement="http://www.example.org/StockQuoteService#
                              wsdl.binding(StockQuoteBinding)"
      wsdli:wsdlLocation="http://www.example.org/StockQuoteService
                         http://www.example.org/StockQuoteService.wsdl"
                    uri="http://www.example.org/StockQuoteService5"/>
   </reference>
</composite>
```

3.2 Examples Without a WSDL Document

The next example shows the simplest form of the binding element without WSDL document, assuming all defaults for portType mapping and SOAP binding synthesis. The service and reference each have a single binding element, whose name defaults to the service/reference name.

The service is to be made available at a location determined by the deployment of this component. It will have a single port address and SOAP binding, with a simple WS-I BasicProfile 1.1 compliant binding, and using the default options for mapping the Java interface to a WSDL portType.

The reference indicates a service to be invoked which has a SOAP binding and portType that matches the default options for binding synthesis and interface mapping. One particular use of this case would be where the reference is to an SCA service with a web service binding which itself uses all the defaults.

```
<?xml version="1.0" encoding="ASCII"?>
<composite xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200712"
           name="MyValueComposite">

   <service name="MyValueService">
      <interface.java interface="services.myvalue.MyValueService"/>
      <binding.ws/>
      ...
   </service>

   ...

   <reference name="StockQuoteService">
      <interface.java interface="services.stockquote.StockQuoteService"/>
      <binding.ws uri="http://www.example.org/StockQuoteService"/>
   </reference>
</composite>
```

The next example shows the use of the binding element without a WSDL document, with multiple SOAP bindings with non-default values. The SOAP 1.2 binding name defaults to the service name, the SOAP 1.1 binding is given an explicit name. The reference has a web service binding which uses SOAP 1.2, but otherwise uses all the defaults for SOAP binding. The reference binding name defaults to the reference name.

```
<?xml version="1.0" encoding="ASCII"?>
<composite xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200712"
           name="MyValueComposite">

   <service name="MyValueService">
      <interface.java interface="services.myvalue.MyValueService"/>
      <binding.ws name="MyValueServiceSOAP11" requires="SOAP.1_1"/>
      <binding.ws requires="SOAP.1_2"/>
      ...
   </service>

   ...

   <reference name="StockQuoteService">
      <interface.java interface="services.stockquote.StockQuoteService"/>
      <binding.ws uri="http://www.example.org/StockQuoteService"
```

```
                  requires="SOAP.1_2"/>
   </reference>
</composite>
```

3.3 Example PolicySet Providing The Conversation Intent

The following policy set applies to *binding.ws* and provides the conversation intent. The conversation intent is provided by using WS-ReliableMessaging [WS-RM] protocol which has a concept of a Sequence. This Sequence (which appears as a wsrm:Sequence SOAP header in the message) is used as a correlation mechanism, on the wire, to implement conversational semantics.

```
<policySet name="WSRM-Sequence-based-conversation"
           provides="sca:conversation"
           appliesTo="sca:binding.ws">
   <wsp:Policy>
     <wsrmp:RMAssertion
                xmlns:wsrmp="http://docs.oasis-open.org/ws-rx/wsrmp/200608"/>
   </wsp:Policy>
</policySet>
```

4 Transport Binding

The binding.ws element provides numerous ways to specify exactly how messages ought to be transmitted from or to the reference or service. Those ways include references to WSDL binding elements from the @wsdlElement attribute, policy intents, and even vendor extensions within the binding.ws element. However, all of those ways to indicate how messages get carried happen to be optional. This section describes the defaults to be used if the specific transport details are not otherwise specified.

4.1 Intents

So as to narrow the range of choices for how messages are carried, the following policy intents affect the transport binding:

- SOAP
  This indicates that messages MUST be transmitted using SOAP. One or more SOAP versions can be used.
- SOAP.1_1
  Messages MUST be transmitted using only SOAP 1.1.
- SOAP.1_2
  Messages MUST be transmitted using only SOAP 1.2.

4.2 Default Transport Binding Rules

4.2.1 WS-I Basic Profile Alignment

To align to WS-I Basic Profile, the resulting WSDL port needs to be all document-literal, or all rpc-literal binding (R2705). This means, for any given portType, for all messages referenced by all operations in that portType, either

- that every message part references an XML Schema type (rpc-literal pattern)
- or that every message references exactly zero or one XML Schema elements (document-literal pattern)

For a service element, the portType from the service's interface or derived from the service's interface MUST fit one of these two patterns. The rest of this section assumes the short-hand reference of an "rpc-literal" or "document-literal" pattern, depending on which of the two bullet points above it matches.

4.2.2 Default Transport Binding Rules

In the event that the transport details are not otherwise determined, an SCA runtime MUST enable the following configuration:

- HTTP-based transfer protocol
- Bindings for SOAP 1.1 MUST be provided and additional bindings MAY be provided, unless policy is applied that explicitly restricts this.
- "literal" format as described in section 3.5 of [WSDL11]
- For document literal pattern, each message uses "document" style, as per section 3.5 of [WSDL11].

- For rpc-literal pattern, each message uses "rpc" style, as per section 3.5 of [WSDL11]. In this case, the child elements of the SOAP Body element MUST be namespace qualified with a non-empty namespace name. This namespace SHOULD be the structural URI associated with the binding.
- For SOAP 1.1 messages, the SOAPAction HTTP header described in section 6.1.1 represents the empty string, in quotes ("").
- For SOAP 1.2 messages, the SOAP Action feature described in section 6.5 of [SOAP12Adjuncts] does not appear.
- All WSDL message parts are carried in the SOAP body

5 Conformance

Any SCA runtime that claims to support this binding MUST abide by the requirements of this specification.

The normative web services binding XML Schema can be obtained by dereferencing the XML Schema namespace, and is also included for convenience in Appendix A. The <binding.ws> element MUST be valid according to its XML Schema.

A. Web Services Binding Schema

```
<?xml version="1.0" encoding="UTF-8"?>

```

B. Appendix - WSDL Generation

Due to the number of factors that determine how a WSDL might be generated, including compatibility with existing WSDL uses, precise details cannot be specified. For example, implementation decisions can affect the way WSDL might be generated. For reference, and consistency, this section suggests non-normative choices for some of the various details involved in generating WSDL. For brevity, the following definitions apply:

- component name = the value of the @name attribute of the component element containing the binding.ws element
- service name = the value of the @name attribute of the service element containing the binding.ws element
- binding name = the value of @name attribute of the binding.ws element, or the default if no @name attribute is present
- SOAP version = either "SOAP11" or "SOAP12" as appropriate

With those definitions in place, here are the suggested choices:

- wsdl:definitions/@name = <component name> + "." + <service name>
- wsdl:definitions/@targetNamespace = <structural URI for the service>
- import each WSDL 1.1 portType, rather than putting them inline
- wsdl:binding/@name = <binding name> + <SOAP version> + "Binding"
- wsdl:service/@name = <service name>
- wsdl:port/@name = <binding name> + <SOAP version> + "Port"

C. Acknowledgements

The following individuals have participated in the creation of this specification and are gratefully acknowledged:

E. Revision History

[optional; should not be included in OASIS Standards]

Revision	Date	Editor	Changes Made
1	2007-09-25	Anish Karmarkar	Applied the OASIS template + related changes to the Submission
2	2008-04-02	Anish Karmarkar	* Partially applied the resolution of issue 14 in the conformance section. * Applied resolution to issue 9. * Applied resolution to issue 15. * Applied resolution to issue 16. * Applied resolution to issue 10. * Applied resolution to issue 8. * Applied resolution to issue 3.
3	2008-06-12	Simon Holdsworth	* Completed application of resolution to issue 10 * Applied most of the editorial changes from Eric Johnson’s review
4	2008-08-13	Anish Karmarkar	* Applied rest of Eric Johnson's ed review comments. * Applied resolution of issue 13. * Reapplied resolution of issue 15 (it was not applied correctly before) * Applied resolution of issue 19. * Applied resolution of issue 30. * Applied resolution of issue 32. * Applied resolution of issue 36. * Applied resolution of issue 38.
cd01-rev1	2008-10-16	Simon Holdsworth	Applied resolution of issue 41.
cd01-rev2	2008-10-20	Anish Karmarkar	Added rfc2119 statements.
cd01-rev3	2008-11-19	Anish Karmarkar	Incorporated feedback from Bryan, Eric & Dave
cd01-rev3	2008-12-02	Anish Karmarkar	Removed 'required' word associated with description of pseudo-schema + changed section 2.6 (wsdl extensibility) per the TC decision. Both of these were associated with issue 51 (2119 stmts)
cd01-rev5	2009-02-06	Simon Holdsworth	Applied resolution of issue 11 Applied resolution of issue 49 Applied action item 20080904-1
cd02	2009-02-16	Simon Holdsworth	Renamed, applied editorial issues
