Abstract:

The Service Component Architecture (SCA) WS-BPEL Client and Implementation model specifies how WS-BPEL 2.0 can be used with SCA. The goal of the specification is to address the following scenarios.

Start from WS-BPEL process. It should be possible to use any valid WS-BPEL process definition as the implementation of a component within SCA. In particular, it should be possible to generate an SCA Component Type from any WS-BPEL process definition and use that type within an SCA assembly. Most BPEL4WS 1.1 process definitions may also be used with SCA by using the backward compatibility approach described in section 4.

Start from SCA Component Type. It should be possible to use WS-BPEL to implement any SCA Component Type that uses only WSDL interfaces to define services and references, possibly with some SCA specific extensions used in process definition.

Start from WS-BPEL with SCA extensions. It should be possible to create a WS-BPEL process definition that uses SCA extensions and generate an SCA Component Type and use that type within an SCA assembly. Some SCA capabilities (such as properties and multi-party references) can only be used by WS-BPEL process definitions that use SCA extensions.

Status:

This document was last revised or approved by the [TC name | membership of OASIS] on the above date. The level of approval is also listed above. Check the “Latest Version” or “Latest Approved Version” location noted above for possible later revisions of this document.

Technical Committee members should send comments on this specification to the Technical Committee’s email list. Others should send comments to the Technical Committee by using the “Send A Comment” button on the Technical Committee’s web page at <http://www.oasis-open.org/committees/sca-bpel/>.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (<http://www.oasis-open.org/committees/sca-bpel/ipr.php>).

The non-normative errata page for this specification is located at <http://www.oasis-open.org/committees/sca-bpel/>.

1 Introduction

2 A WS-BPEL process definition may be used as the implementation of an SCA component.

3
4 Such a component definition has the following form:

```
5 <component ... >
6 ...
7 ...
8 ...
9 ...
10 ...
11 ...
12 ...
13 ...
14 ...
15 ...
16 ...
17 ...
18 ...
19 ...
20 ...
21 ...
22 ...
23 ...
24 ...
25 ...
26 ...
27 ...
28 ...
29 ...</component>
```

15 The only aspect of this that is specific to WS-BPEL is the `<implementation.bpel>` element. The
16 `process` attribute of that element specifies the target QName of some executable WS-BPEL
17 process.

1.1 Terminology

19 The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD
20 NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described
21 in [RFC2119].

22 1.2 Normative References

- 23 [RFC2119] S. Bradner, *Key words for use in RFCs to Indicate Requirement Levels*,
24 <http://www.ietf.org/rfc/rfc2119.txt>, IETF RFC 2119, March 1997.

31 [Reference] [Full reference citation]

32 2 Component Types defined by WS-BPEL Processes

33 While a WS-BPEL process definition provides an implementation that can be used by a component,
34 the process definition also determines the **ComponentType** of any SCA component that uses that
35 implementation. The component type represents the aspects of the implementation that SCA
36 needs to be aware of in order to support assembly and deployment of components that use that
37 implementation. The generic form of a component type is defined in the SCA Assembly
38 Specification [**SCA-Assembly**].

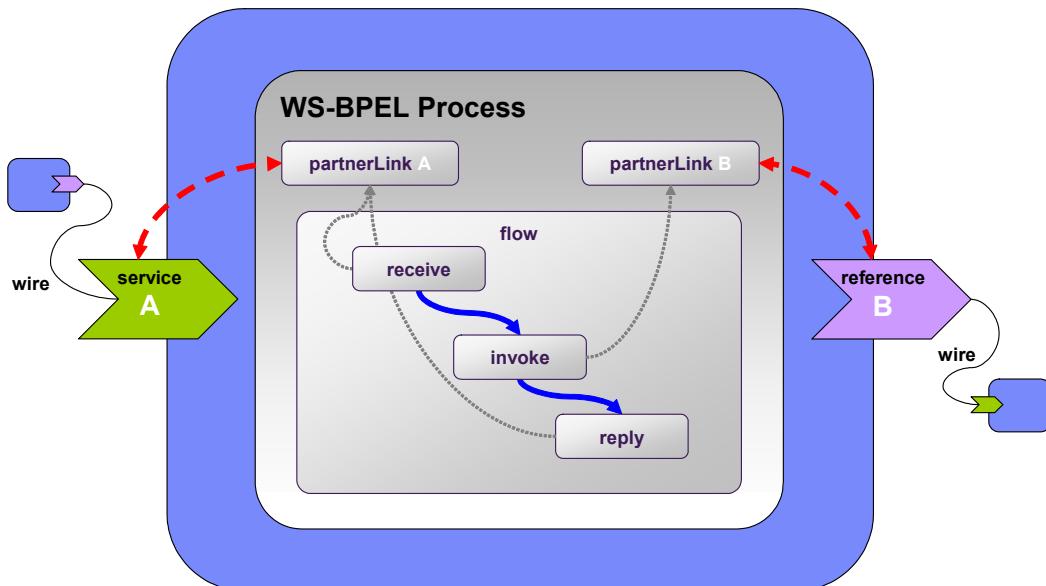

```
39 <componentType ... >  
40     <service name="xs:NCName" ... > ... </service>  
41     <reference name="xs:NCName" ... > ... </reference>  
42     <property name="xs:NCName" ... > ... </property>  
43     <implementation ... />  
44  
45 </componentType>
```

50 The component type MAY be generated from a WS-BPEL process definition by introspection.

51 2.1 Services and References

52 In SCA, both *services* and *references* correspond to WS-BPEL's concept of partner link. In SCA,
53 the difference between a service and a reference is determined by which party sends the first
54 message in a conversation. No matter of how many messages a bi-directional conversation
55 involves or how long it takes, there is always a first message. The sender of the first message is
56 considered to be the *client* and the receiver is the *service provider*. Messages that go from the
57 service provider to the client are called *callback messages*.

58 WS-BPEL's partner links are not differentiated based on who sends the first message. So, in order
59 to map a WS-BPEL process to an SCA Component Type, it is necessary to determine which role
60 sends the first message. A simple static analysis of the control flow, which does not involve
61 determining the values of any expressions, will be used to determine which role can send the first
62 message.

63
64

65 **Services:** If a static analysis of the process determines that it is possible that the first message
66 for a partner link will be received in a <receive> activity, the <onMessage> element of a <pick>
67 activity or the <onEvent> element of an event handler then the partner link MUST be associated
68 with a corresponding SCA service in the component type. If the partner link declaration has
69 initializePartnerRole="yes", then the service MUST be configured using a binding that
70 knows the identity of the partner as soon as the partner link becomes active (e.g. the binding
71 cannot depend on using a "reply-to" field as the mechanism to initialize partner role.).

72 **References:** If a static analysis of the process does not determine that the partner link should
73 map to an SCA service, then the partner link is mapped to an SCA reference in the component
74 type.

75 The *multiplicity* of the reference is determined by the following algorithm:

- 76 1. **Multi-Reference.** If the partner link is declared with sca-
77 bpel:multiRefFrom="aVariableName" extension, the multiplicity of the SCA reference will
78 be determined by the multiplicity attribute of sca-bpel:multiReference extension used in
79 the corresponding variable. The multiplicity declaration of the variable which is either 0..n
80 or 1..n. Details of these extensions are described in section 3.2.
- 81 2. **Required Reference.** If not (1) and the partner link has
82 initializePartnerRole="yes", then the multiplicity is 1..1 (i.e. it's a *required*
83 reference).
- 84 3. **Stub Reference.** If not (1) or (2) and if the analysis of the process determines that the
85 first use of the partner link by any activity is in an assign activity that sets the partner
86 role, then the multiplicity is "0..1" and the attribute wiredByImpl is set to "true". A
87 reference with wiredByImpl="true" is referred to as a *stub reference*. Although the
88 target can't be set for such a reference, SCA can still apply bindings and policies to it and
89 may need to set the endpoint address for callbacks, if the interface is bi-directional.
- 90 4. **Optional Reference.** If not (1) or (2) or (3) then the multiplicity="0..1".

91 For both services and references, the name of the service or reference is the name partner link,
92 when that name is unique (see the "Handling Local Partner Links" section below, for how to handle
93 ambiguous cases).

94 2.2 PartnerLinkTypes and SCA Interfaces

95 When a partner link is determined to correspond to an SCA service, the type of the service is
96 determined by the partner link type of the partner link. The role that the partner link specified as
97 *myRole* provides the WSDL port type of the service. If the partner link type has two roles, then
98 the *partnerRole* provides the WSDL port type of the callback interface.

99 Consider an example that uses one of the partner link types used as an example in the WS-BPEL
100 specification. The partner link type definition is:

```
101 <plnk:partnerLinkType name="invoicingLT">
102   <plnk:role name="invoiceService"
103     portType="pos:computePricePT" />
104   <plnk:role name="invoiceRequester"
105     portType="pos:invoiceCallbackPT" />
106 </plnk:partnerLinkType>
```

107 The "invoiceProcess", which provides invoice services, would define a partner link that uses that
108 type with a declaration that would look like:

```
109 <partnerLink name="invoicing"
110   partnerLinkType="lns:invoicingLT"
111   myRole="invoiceService"
112   partnerRole="invoiceRequester" />
```

113 Somewhere in the process, a start activity would use that partner link, which might look like:

```
114 <receive partnerLink="invoicing"
115   portType="pos:computePricePT"
116   operation="initiatePriceCalculation"
117   variable="PO"
118   createInstance="yes" />
```

119 Because the partner link is used in a start activity, SCA maps that partner link to a service for on
120 the component type. In this case, the service element of the component type would be:

```
121 <service name="invoicing">
122   <interface.wsdl
123     interface="http://manufacturing.org/wsdl/purchase#
124       wsdl.interface(computePricePT)"
125     callbackInterface="http://manufacturing.org/wsdl/purchase#
126       wsdl.interface(invoiceCallbackPT)" />
127 </service>
```

128 Conversely, when a partner link is determined to correspond to an SCA reference, the role that the
129 partner link specified as *partnerRole* provides the WSDL port type of the reference. If the partner
130 link type has two roles, then the *myRole* provides the WSDL port type of the callback interface.

131 2.3 Specifying an SCA interface with a partnerLinkType

132 In the approach described above, the SCA definition of service and reference uses the
133 <interface.wsdl> which restates the association between the interface and the callback
134 interface that is already present in the WS-BPEL partnerLinkType. A partnerLinkType defines the
135 relationship between two services by specifying roles the services play in the conversation. A
136 partnerLinkType specifies at least one role.

137 For users that prefer this WS-BPEL element, it is also possible to define interfaces with an
138 alternative partnerLinkType form of an interface type. This form does not provide any more
139 information than is present in the <interface.wsdl> element. The example above would look
140 like the following:

```
141 <interface.partnerLinkType type="lns:invoicingLT"
142   serviceRole="invoiceService" />
```

143 The generic form of this interface type definition is as follows:

```
144 <interface.partnerLinkType type="xs:QName"
145   serviceRole="xs:NCName"? />
```

146 The *type* attribute is mandatory and references a partner link type. In case the partner link type
147 has two roles, the optional attribute *serviceRole* MUST be used to specify which of the two roles
148 is used as the interface. The other role is used as the callback. If the partnerLinkType has only one
149 role, it cannot be a callback. Moreover, the *serviceRole* attribute MAY be omitted.

150 This form has a couple advantages over the interface.wsdl form. It is more concise. It also
151 doesn't restate the link between the interface and the callbackInterface, so with this form, the
152 partnerLinkType could change the portType used to define one of the roles and all of the SCA
153 componentTypes that use that partnerLinkType would remain accurate without having to also
154 change the interface definitions for those componentTypes. This form also may be more familiar
155 to some users.

156 **2.4 Handling of Local PartnerLinks**

157 It is possible to declare partnerLinks local to a <scope> in WS-BPEL, besides declaring
158 partnerLinks at the <process> level. The names of partnerLink declared in different <scope>
159 may potentially share the identical name. In case of this name sharing situation, the following
160 scheme is used to disambiguate different occurrences of partnerLink declaration:

- 161 • Suppose "originalName" is the original NCName used in multiple partnerLink declarations
162 • When these partnerLinks are exposed to SCA assembly, these partnerLinks will given
163 aliases from "_orginalName_1" to "_orginalName_N" regardless of how partnerLink
164 participate in SCA assembly (i.e. services vs. references) and the number suffixes are
165 based on the lexical order of the corresponding partnerLink occurrences in the process
166 definition.
167 • If any "_orginalName_i" (where 1 <= i <= N) is already taken by existing partnerLink
168 declaration in the process definition, additional underscore characters may be added at the
169 beginning of all aliases consistently to avoid collision.

170 **2.5 Support for conversational interfaces**

171 WS-BPEL can be used to implement an SCA Component with *conversational* services. See the SCA
172 Assembly Specification [**SCA-Assembly**] for a description of conversational interfaces. When an
173 interface that has been marked as conversational is used for a role of a partner link, no other
174 mechanism (such as the WS-BPEL correlation mechanism) is needed to correlate messages on
175 that partner link, although it is still allowed. This means the SCA conversational interface is used
176 as an implicit correlation mechanism to associate all messages exchanged (in either direction) on
177 that partner link to a single conversation. When the EPR of the partnerRole is initialized a new
178 conversation MUST be used for an operation of the conversational service.

179 Any process which, through static analysis, can be proved to use an operation on a conversational
180 interface after an *endsConversation* operation has completed SHOULD be rejected. In cases
181 where the static analysis cannot determine that such a situation could occur, then at runtime a
182 *sca:ConversationViolation* fault would be generated when using a conversational partner link after
183 the conversation has ended. See the SCA Assembly Specification [**SCA-Assembly**], section 1.5.3
184 for a description of this fault.

185 It is important to point out that the WS-BPEL correlation mechanism is not restricted to a single
186 partner link. It can be used to associate messages exchanged on different partner links to a
187 particular WS-BPEL process instance.

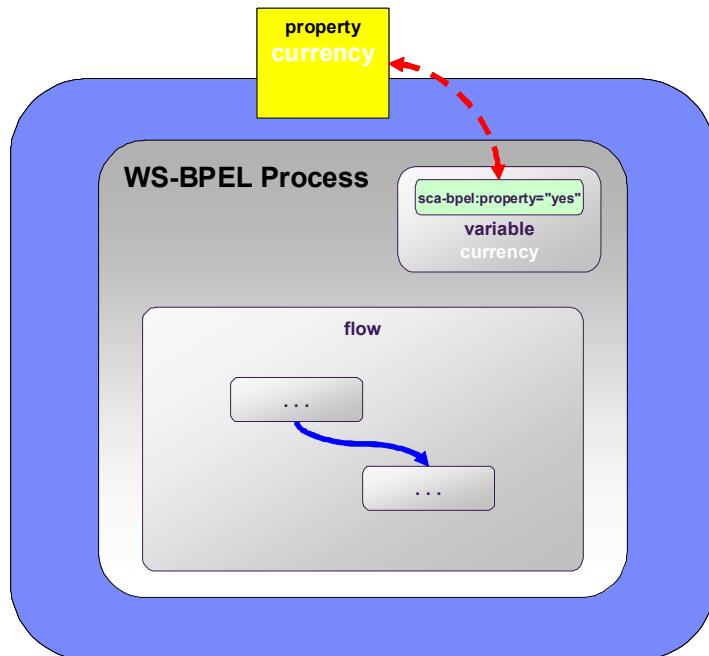

188 3 SCA Extensions to WS-BPEL

189 It is possible to use WS-BPEL processes in conjunction with SCA, while the processes have no
190 knowledge of SCA. A few SCA concepts are only available to WS-BPEL processors that support
191 SCA specific extensions. The capabilities that require knowledge of SCA are provided by an SCA
192 extension, which must be declared in any process definition as follows:

```
193 <process ...>
194   <extensions>
195     <extension namespace="http://www.osoa.org/xmlns/sca/bpel/1.0"
196       mustUnderstand="yes" />
197   </extensions>
198   ...
199 </process>
```

200 3.1 Properties

201 A WS-BPEL variable declaration may include an SCA extension that says that the variable
202 represents an SCA property for the component represented by the WS-BPEL process.

203 The declaration looks like the following:

```
204 <variable name="currency" type="xsd:string"
205   sca-bpel:property="yes" />
```

206 When `sca-bpel:property="yes"` is used on a variable declaration, the name of the variable is
207 used as the name of a property of the component type represented by the WS-BPEL process. The
208 name of the variable must be unique within the process.

209 If the variable has an initialization from-spec, then that becomes the default value for the variable
210 in cases where the SCA component does not provide a value for that property.

211 If the from-spec is a literal value, where it has the following form:

```
212   <from><literal>literal value</literal></from>
```

214

215 then the literal value will be represented as the default value in the component type for the
216 process. Any other kind of initialization from-spec will not be represented in the component type.
217 However, even though the other kinds of initialization from-spec are not represented in the
218 component type, they would still be computed and used as the default value for the property when
219 the component does not provide a value for that property.

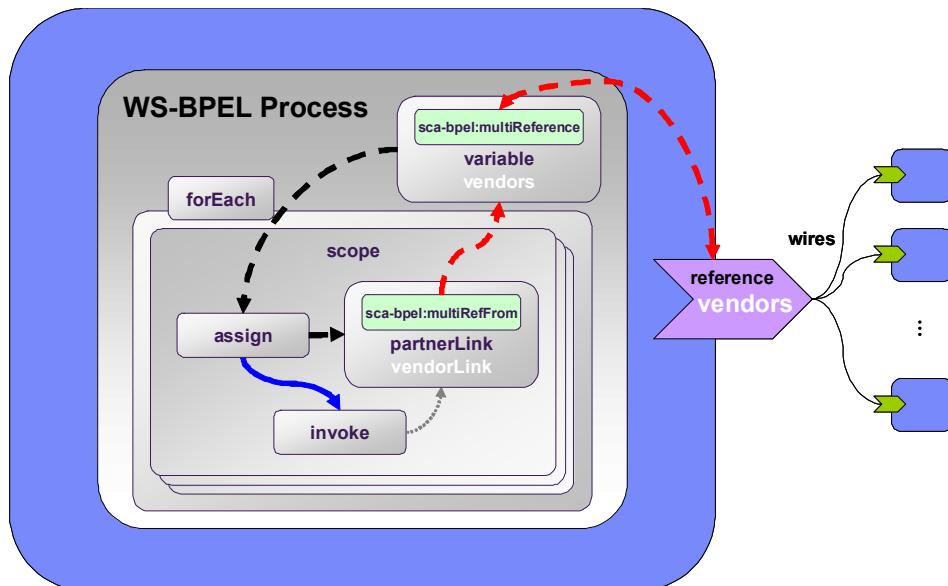

220 If a value is provided for the property, any initialization from-spec MUST still be evaluated, but the
221 value of the variable will be changed to the provided property value immediately after the
222 initialization is evaluated, and specifically, before any following variable initialization from-spec is
223 evaluated. Thus, any side effects that result from the execution of the initialization from-spec will
224 occur irrespective of whether the property is set.

225 If a BPEL variable that is used as a property has an initialization from-spec then
226 mustSupply="false" must be specified on the component type property declaration, even if the
227 default value is not literal and therefore not represented in the component type.

228

229 3.2 Multi-Valued References

230 Component types may declare references with a multiplicity that allows a single reference to be
231 wired to multiple targets. An example use of this capability is a purchasing component wired to a
232 list of accepted vendors. SCA assumes that each programming language binding will provide its
233 own approach for making the list of targets available within that programming language.

234

235 In WS-BPEL, a variable may include an sca-bpel:multiReference extension element that declares
236 that the variable represents a multi-valued reference. The type of the variable must be an
237 element of sca-bpel:serviceReferenceList. However, since that type only specifies that the
238 variable holds a list of endpoint references, the sca-bpel:multiReference element also has
239 attributes to specify the partner link type and partner role of the target of the reference. An
240 example of a variable that represents a list of references to vendors would look like:

```
241 <variable name="vendors" element="sca-bpel:serviceReferenceList">
242   <sca-bpel:multiReference partnerLinkType="pos:vendorPT"
243     partnerRole="vendor" />
244 </variable>
```

245 Syntax of this extension:

```
246 <sca-bpel:multiReference partnerLinkType="xs:QName" partnerRole="xs:NCName"
247   multiplicity="0..n or 1..n"? />
```

248 The default value of multiplicity is "1..n".

249 The sca-bpel:serviceReferenceList element declaration is the following:

```
250 <xsd:element name="serviceReferenceList">
251   <xsd:complexType>
252     <xsd:sequence>
253       <xsd:element ref="sref:service-ref"
254         minOccurs="0" maxOccurs="unbounded" />
255     </xsd:sequence>
256   </xsd:complexType>
257 </xsd:element>
```

258 A typical use of a variable that holds a multi-valued reference would be to have a <forEach>
259 activity with an iteration for each element in the list. The body of the <forEach> activity would
260 declare a local partner link and assign one of the list elements to the local partner link. Such a
261 local partner link is typically categorized as the "References" case 1 listed in section 2.1.

262 To assist a more effective SCA modeling, another SCA extension is introduced to associate a
263 multi-valued reference, manifested as a "sca-bpel:serviceReferenceList" variable with a partner
264 link. This extension is in an attribute form attached to the partner link declaration. Syntax of this
265 extension is:

```
266 <partnerLink ... sca-bpel:multiRefFrom="xs:NCName" />
```

267 The attribute value must refer to the name of a variable manifesting an SCA multi-valued
268 reference. The partnerLinkType and partnerRole attributes of the partner link and multi-valued
269 reference variable must be matched. Also, there must be at least one code-path that values from
270 the multi-valued reference variable are copied to the partnerRole of the partner link.

271 If any above constraints are violated, it will be considered an error during static analysis.

272 When this sca-bpel:multiRefFrom extension is applied to pair up a multi-valued reference variable
273 and a partner link which is categorized as the "References" case 1 (as described in section 2.1),
274 the partner link and variable are manifested as a single multi-valued reference entity in SCA
275 assembly model using the name of the variable. If the interface involved is bi-directional, this
276 implies the wiring of the bi-directional interface as a single reference in SCA.

277 For example:

```
278 <process>
279 ...
280   <variable name="vendors" element="sca-bpel:serviceReferenceList">
281     <sca-bpel:multiReference partnerLinkType="pos:vendorPT"
282       partnerRole="vendor" />
283   </variable>
284 ...
285   <forEach counterName="idx" ...>
286     <startCounterValue>1</startCounterValue>
287     <finalCounterValue>
288       count($vendors/bpel:service-ref)
289     </finalCounterValue>
290     ...
291     <scope>
```

```

292     ...
293     <partnerLink name="vendorLink"
294         partnerLinkType="pos:vendorPT"
295         partnerRole="vendor"
296         myRole="quoteRequester"
297         sca-bpel:multiRefFrom="vendors" />
298     ...
299     <assign>
300         <copy>
301             <from>$vendors/bpel:service-ref[$idx]</from>
302             <to partnerLink="vendorLink" />
303         </copy>
304     </assign>
305     ...
306     </scope>
307 </forEach>
308 ...
309 </process>
```

310 A multi-valued reference named "vendors" is declared in the example above. The partner link
 311 named "vendorLink", which is categorized as the "References" case 1, is not manifested directly
 312 into the SCA Assembly Model. The extra `sca-bpel:multiRefFrom="vendors"` extension associates
 313 the "vendorLink" partner link with multi-valued reference variable "vendors". Consequently, the
 314 partner link and variable are manifested as a single multi-valued reference named "vendors" in
 315 SCA. This makes the SCA Assembly modeling easier to follow.

316

4 Using BPEL4WS 1.1 with SCA

317

A BPEL4WS 1.1 process definition may be used as the implementation of an SCA component. The syntax introduced in section Introduction is used to define a component having a BPEL4WS 1.1 process as the implementation. In this case, the process attribute specifies the target QName of a BPEL4WS 1.1 executable process.

318

A BPEL4WS 1.1 process definition may be used to generate an SCA Component Type.

322

5 Conformance

323

(tbd.)
