

# Service Component Architecture Java Common Annotations and APIs Specification Version 1.1

Committee Draft 02, Revision  
01+AnnotationsMerge+Issue27

03 February 2009

**Specification URIs:**

**This Version:**

<http://docs.oasis-open.org/opencsa/sca-j/sca-javacaa-1.1-spec-cd02-rev1.html>  
<http://docs.oasis-open.org/opencsa/sca-j/sca-javacaa-1.1-spec-cd02-rev1.doc>  
<http://docs.oasis-open.org/opencsa/sca-j/sca-javacaa-1.1-spec-cd02-rev1.pdf> (normative)

**Previous Version:**

**Latest Version:**

<http://docs.oasis-open.org/opencsa/sca-j/sca-javacaa-1.1-spec.html>  
<http://docs.oasis-open.org/opencsa/sca-j/sca-javacaa-1.1-spec.doc>  
<http://docs.oasis-open.org/opencsa/sca-j/sca-javacaa-1.1-spec.pdf>

**Latest Approved Version:**

**Technical Committee:**

OASIS Service Component Architecture / J (SCA-J) TC

**Chair(s):**

Simon Nash,	IBM
Michael Rowley,	BEA Systems
Mark Combella,	Avaya

**Editor(s):**

Ron Barack,	SAP
David Booz,	IBM
Mark Combella,	Avaya
Mike Edwards,	IBM
Anish Karmarkar,	Oracle
Ashok Malhotra,	Oracle
Peter Peshev,	SAP

**Related work:**

This specification replaces or supersedes:

- Service Component Architecture Java Annotations and APIs Specification Version 1.00, March 21 2007

This specification is related to:

- Service Component Architecture Assembly Model Specification Version 1.1

- Service Component Architecture Policy Framework Specification Version 1.1

**Declared XML Namespace(s):**

<http://docs.oasis-open.org/ns/opencsa/sca/200712>

**Abstract:**

The SCA Java Common Annotation and APIs specify a Java syntax for programming concepts defined in the SCA Assembly Model Specification. It specifies a set of APIs and annotations that may can be used by Java-based SCA specifications.

Specifically, this specification covers:

1. Implementation metadata for specifying component services, references, and properties
2. A client and component API
3. Metadata for asynchronous services
4. Metadata for callbacks
5. Definitions of standard component implementation scopes
6. Java to WSDL and WSDL to Java mappings
7. Security policy annotations

Note that individual programming models may can chose to implement their own mappings of assembly model concepts using native APIs and idioms when appropriate.

**Status:**

This document was last revised or approved by the OASIS Service Component Architecture / J (SCA-J) TC on the above date. The level of approval is also listed above. Check the "Latest Version" or "Latest Approved Version" location noted above for possible later revisions of this document.

Technical Committee members should send comments on this specification to the Technical Committee's email list. Others should send comments to the Technical Committee by using the "Send A Comment" button on the Technical Committee's web page at <http://www.oasis-open.org/committees/sca-j/>.

For information on whether any patents have been disclosed that may might be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (<http://www.oasis-open.org/committees/sca-j/ipr.php>).

The non-normative errata page for this specification is located at <http://www.oasis-open.org/committees/sca-j/>.

## Notices

Copyright © OASIS® 2005, 2008. All Rights Reserved.

All capitalized terms in the following text have the meanings assigned to them in the OASIS Intellectual Property Rights Policy (the "OASIS IPR Policy"). The full Policy may be found at the OASIS website.

This document and translations of it may be copied and furnished to others, and derivative works that comment on or otherwise explain it or assist in its implementation may be prepared, copied, published, and distributed, in whole or in part, without restriction of any kind, provided that the above copyright notice and this section are included on all such copies and derivative works. However, this document itself may not be modified in any way, including by removing the copyright notice or references to OASIS, except as needed for the purpose of developing any document or deliverable produced by an OASIS Technical Committee (in which case the rules applicable to copyrights, as set forth in the OASIS IPR Policy, must be followed) or as required to translate it into languages other than English.

The limited permissions granted above are perpetual and will not be revoked by OASIS or its successors or assigns.

This document and the information contained herein is provided on an "AS IS" basis and OASIS DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY OWNERSHIP RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

OASIS requests that any OASIS Party or any other party that believes it has patent claims that would necessarily be infringed by implementations of this OASIS Committee Specification or OASIS Standard, to notify OASIS TC Administrator and provide an indication of its willingness to grant patent licenses to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification.

OASIS invites any party to contact the OASIS TC Administrator if it is aware of a claim of ownership of any patent claims that would necessarily be infringed by implementations of this specification by a patent holder that is not willing to provide a license to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification. OASIS may include such claims on its website, but disclaims any obligation to do so.

OASIS takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on OASIS' procedures with respect to rights in any document or deliverable produced by an OASIS Technical Committee can be found on the OASIS website. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this OASIS Committee Specification or OASIS Standard, can be obtained from the OASIS TC Administrator. OASIS makes no representation that any information or list of intellectual property rights will at any time be complete, or that any claims in such list are, in fact, Essential Claims.

The names "OASIS", [insert specific trademarked names and abbreviations here] are trademarks of OASIS, the owner and developer of this specification, and should be used only to refer to the organization and its official outputs. OASIS welcomes reference to, and implementation and use of, specifications, while reserving the right to enforce its marks against misleading uses. Please see <http://www.oasis-open.org/who/trademark.php> for above guidance.

# 1 Introduction

The SCA Common Annotation, APIs, Client and Implementation Model specifies a Java syntax for programming concepts defined in the SCA Assembly Model Specification [ASSEMBLY]. It specifies a set of APIs and annotations that may can be used by Java-based SCA specifications.

Specifically, this specification covers:

1. Implementation metadata for specifying component services, references, and properties
2. A client and component API
3. Metadata for asynchronous services
4. Metadata for callbacks
5. Definitions of standard component implementation scopes
6. Java to WSDL and WSDL to Java mappings
7. Security policy annotations

Note that individual programming models may can chose to implement their own mappings of assembly model concepts using native APIs and idioms when appropriate.

The goal of specifying the annotations, APIs, client and implementation model in this specification is to promote consistency and reduce duplication across various Java-related component implementation type specifications. The annotations, APIs, client and implementation model defined in this specification are designed to be used by other SCA Java-related specifications in either a partial or complete fashion.

This document defines implementation metadata using the annotation capability from Java™ 2 Standard Edition (J2SE) 5. However, SCA also allows service clients and implementations to be written using J2SE 1.4. All metadata that is represented by annotations can also be expressed using a component type side file, as defined in the SCA Assembly Specification [ASSEMBLY].

## 1.1 Terminology

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described in [\[RFC2119\]](#).

## 1.2 Normative References

## 53 2 Implementation Metadata

54 This section describes SCA Java-based metadata, which applies to Java-based implementation  
55 types.

### 56 2.1 Service Metadata

#### 57 2.1.1 @Service

58  
59 The **@Service annotation** is used on a Java class to specify the interfaces of the services  
60 implemented by the implementation. Service interfaces are defined in one of the following ways:

- 61 • As a Java interface
- 62 • As a Java class
- 63 • As a Java interface generated from a Web Services Description Language [WSDL]  
64 (WSDL) portType (Java interfaces generated from a WSDL portType are always  
65 **remotable**)

#### 66 2.1.2 Java Semantics of a Remotable Service

67 A **remotable service** is defined using the @Remotable annotation on the Java interface that  
68 defines the service. Remotable services are intended to be used for **coarse grained** services, and  
69 the parameters are passed **by-value**. Remotable Services are not allowed to make use of method  
70 **overloading**.

71 The following snippet shows an example of a Java interface for a remote service:

```
72 package services.hello;  
73 @Remotable  
74 public interface HelloService {  
75     String hello(String message);  
76 }  
77
```

#### 78 2.1.3 Java Semantics of a Local Service

79 A **local service** can only be called by clients that are deployed within the same address space as  
80 the component implementing the local service.

81 A local interface is defined by a Java interface with no @Remotable annotation or it is defined by a  
82 Java class.

83 The following snippet shows an example of a Java interface for a local service:

```
84 package services.hello;  
85 public interface HelloService {  
86     String hello(String message);  
87 }  
88
```

89 The style of local interfaces is typically **fine grained** and is intended for **tightly coupled**  
90 interactions.

91 The data exchange semantic for calls to local services is **by-reference**. This means that code must  
92 be written with the knowledge that changes made to parameters (other than simple types) by  
93 either the client or the provider of the service are visible to the other.

## 94 2.1.4 @Reference

95 Accessing a service using reference injection is done by defining a field, a setter method  
96 parameter, or a constructor parameter typed by the service interface and annotated with a  
97 **@Reference** annotation.

## 98 2.1.5 @Property

99 Implementations can be configured with data values through the use of properties, as defined in  
100 the SCA Assembly specification [ASSEMBLY]. The **@Property** annotation is used to define an SCA  
101 property.

## 102 2.2 Implementation Scopes: @Scope, @Init, @Destroy

103 Component implementations can either manage their own state or allow the SCA runtime to do so.  
104 In the latter case, SCA defines the concept of **implementation scope**, which specifies a visibility  
105 and lifecycle contract an implementation has with the SCA runtime. Invocations on a service  
106 offered by a component will be dispatched by the SCA runtime to an **implementation instance**  
107 according to the semantics of its implementation scope.

108 Scopes are specified using the **@Scope** annotation on the implementation class.

109 This document defines two scopes:

- 110 • STATELESS
- 111 • COMPOSITE

112 Java-based implementation types can choose to support any of these scopes, and they can define  
113 new scopes specific to their type.

114 An implementation type can allow component implementations to declare **lifecycle methods** that  
115 are called when an implementation is instantiated or the scope is expired.

116 **@Init** denotes a method called upon first use of an instance during the lifetime of the scope  
117 (except for composite scoped implementation marked to eagerly initialize, see [section Composite](#)  
118 [Scope](#)).

119 **@Destroy** specifies a method called when the scope ends.

120 Note that only no argument methods with a void return type can be annotated as lifecycle  
121 methods.

122 The following snippet is an example showing a fragment of a service implementation annotated  
123 with lifecycle methods:

```
124  
125     @Init  
126     public void start() {  
127         ...  
128     }  
129  
130     @Destroy  
131     public void stop() {  
132         ...  
133     }  
134
```

135 The following sections specify the two standard scopes which a Java-based implementation type  
136 can support.

### 137 2.2.1 Stateless scope

138 For stateless scope components, there is no implied correlation between implementation instances  
139 used to dispatch service requests.

140 The concurrency model for the stateless scope is single threaded. This means that the SCA  
141 runtime MUST ensure that a stateless scoped implementation instance object is only ever  
142 dispatched on one thread at any one time. In addition, within the SCA lifecycle of an instance, the  
143 SCA runtime MUST only make a single invocation of one business method. Note that the SCA  
144 lifecycle might not correspond to the Java object lifecycle due to runtime techniques such as  
145 pooling.

## 146 2.2.2 Composite scope

147 All service requests are dispatched to the same implementation instance for the lifetime of the  
148 containing composite. The lifetime of the containing composite is defined as the time it becomes  
149 active in the runtime to the time it is deactivated, either normally or abnormally.

150 A composite scoped implementation may also specify eager initialization using the **@EagerInit**  
151 annotation. When marked for eager initialization, the composite scoped instance is created when  
152 its containing component is started. If a method is marked with the @Init annotation, it is called  
153 when the instance is created.

154 The concurrency model for the composite scope is multi-threaded. This means that the SCA  
155 runtime MAY run multiple threads in a single composite scoped implementation instance object  
156 and it MUST NOT perform any synchronization.

## 157 3 Interface

158 This section describes the SCA Java interface element and the SCA metadata for Java interfaces.

### 159 3.1 Java interface element – <interface.java>

160 The Java interface element is used in SCDL files in places where an interface is declared in terms  
161 of a Java interface class. The Java interface element identifies the Java interface class and  
162 optionally identifies a callback interface, where the first Java interface represents the forward  
163 (service) call interface and the second interface represents the interface used to call back from the  
164 service to the client.

165  
166 The following is the pseudo-schema for the interface.java element

```
167  
168 <interface.java interface="NCName" callbackInterface="NCName"? />  
169
```

170 The interface.java element has the following attributes:

- 171 • **interface (1..1)** – the Java interface class to use for the service interface. [@interface MUST](#)  
172 [be the fully qualified name of the Java interface class \[JCA30001\]](#)
- 173 • **callbackInterface (0..1)** – the Java interface class to use for the callback interface.  
174 [@callbackInterface MUST be the fully qualified name of a Java interface used for callbacks](#)  
175 [\[JCA30002\]](#)

176  
177 The following snippet shows an example of the Java interface element:

```
178  
179 <interface.java interface="services.stockquote.StockQuoteService"  
180   callbackInterface="services.stockquote.StockQuoteServiceCallback"/>  
181
```

182 Here, the Java interface is defined in the Java class file  
183 ./services/stockquote/StockQuoteService.class, where the root directory is defined by the  
184 contribution in which the interface exists. Similarly, the callback interface is defined in the Java  
185 class file ./services/stockquote/StockQuoteServiceCallback.class.

186 Note that the Java interface class identified by the @interface attribute can contain a Java  
187 @Callback annotation which identifies a callback interface. If this is the case, then it is not  
188 necessary to provide the @callbackInterface attribute. [However, if the Java interface class](#)  
189 [identified by the @interface attribute does contain a Java @Callback annotation, then the Java](#)  
190 [interface class identified by the @callbackInterface attribute MUST be the same interface class.](#)  
191 [\[JCA30003\]](#)

192 For the Java interface type system, parameters and return types of the service methods are  
193 described using Java classes or simple Java types. It is recommended that the Java Classes used  
194 conform to the requirements of either JAXB [JAX-B] or of Service Data Objects [SDO] because of  
195 their integration with XML technologies.

196  
197

## 198 3.2 @Remotable

199 The **@Remotable** annotation on a Java interface indicates that the interface is designed to be  
200 used for remote communication. Remotable interfaces are intended to be used for **coarse**  
201 **grained** services. Operations' parameters and return values are passed **by-value**. Remotable  
202 Services are not allowed to make use of method **overloading**.

## 203 3.3 @Callback

204 A callback interface is declared by using a @Callback annotation on a Java service interface, with  
205 the Java Class object of the callback interface as a parameter. There is another form of the  
206 @Callback annotation, without any parameters, that specifies callback injection for a setter method  
207 or a field of an implementation.

---

## 208 4 Client API

209 This section describes how SCA services may can be programmatically accessed from components  
210 and also from non-managed code, i.e. code not running as an SCA component.

### 211 4.1 Accessing Services from an SCA Component

212 An SCA component may can obtain a service reference either through injection or  
213 programmatically through the **ComponentContext** API. Using reference injection is the  
214 recommended way to access a service, since it results in code with minimal use of middleware  
215 APIs. The ComponentContext API is provided for use in cases where reference injection is not  
216 possible.

#### 217 4.1.1 Using the Component Context API

218 When a component implementation needs access to a service where the reference to the service is  
219 not known at compile time, the reference can be located using the component's  
220 ComponentContext.

### 221 4.2 Accessing Services from non-SCA component implementations

222 This section describes how Java code not running as an SCA component that is part of an SCA  
223 composite accesses SCA services via references.

#### 224 4.2.1 ComponentContext

225 Non-SCA client code can use the ComponentContext API to perform operations against a  
226 component in an SCA domain. How client code obtains a reference to a ComponentContext is  
227 runtime specific.

228 The following example demonstrates the use of the component Context API by non-SCA code:

229

```
230 ComponentContext context = // obtained via host environment-specific means  
231 HelloService helloService =  
232     context.getService(HelloService.class, "HelloService");  
233 String result = helloService.hello("Hello World!");
```

234

---

## 5 Error Handling

235  
236

Clients calling service methods may experience business exceptions and SCA runtime exceptions.

237  
238

Business exceptions are thrown by the implementation of the called service method, and are defined as checked exceptions on the interface that types the service.

239  
240  
241

SCA runtime exceptions are raised by the SCA runtime and signal problems in management of component execution or problems interacting with remote services. The SCA runtime exceptions are [defined in the Java API section](#).

## 242 6 Asynchronous Programming

243 Asynchronous programming of a service is where a client invokes a service and carries on  
244 executing without waiting for the service to execute. Typically, the invoked service executes at  
245 some later time. Output from the invoked service, if any, must be fed back to the client through a  
246 separate mechanism, since no output is available at the point where the service is invoked. This is  
247 in contrast to the call-and-return style of synchronous programming, where the invoked service  
248 executes and returns any output to the client before the client continues. The SCA asynchronous  
249 programming model consists of:

- 250 • support for non-blocking method calls
- 251 • callbacks

252 Each of these topics is discussed in the following sections.

### 253 6.1 @OneWay

254 **Nonblocking calls** represent the simplest form of asynchronous programming, where the client of  
255 the service invokes the service and continues processing immediately, without waiting for the  
256 service to execute.

257 Any method with a void return type and has no declared exceptions may be marked with a  
258 **@OneWay** annotation. This means that the method is non-blocking and communication with the  
259 service provider may use a binding that buffers the requests and sends it at some later time.

260 For a Java client to make a non-blocking call to methods that either return values or which throw  
261 exceptions, a Java client can use the JAX-WS asynchronous client API model that is described in  
262 section 9. It is considered to be a best practice that service designers define one-way methods as  
263 often as possible, in order to give the greatest degree of binding flexibility to deployers.

### 264 6.2 Callbacks

265 A **callback service** is a service that is used for **asynchronous** communication from a service  
266 provider back to its client, in contrast to the communication through return values from  
267 synchronous operations. Callbacks are used by **bidirectional services**, which are services that  
268 have two interfaces:

- 269 • an interface for the provided service
- 270 • a callback interface that must be provided by the client

271 Callbacks may can be used for both remotable and local services. Either both interfaces of a  
272 bidirectional service must be remotable, or both must be local. It is illegal to mix the two.

273 A callback interface is declared by using a **@Callback** annotation on a service interface, with the  
274 Java Class object of the interface as a parameter. The annotation may can also be applied to a  
275 method or to a field of an implementation, which is used in order to have a callback injected, as  
276 explained in the next section.

#### 277 6.2.1 Using Callbacks

278 Bidirectional interfaces and callbacks are used when a simple request/response pattern isn't  
279 sufficient to capture the business semantics of a service interaction. Callbacks are well suited for  
280 cases when a service request can result in multiple responses or new requests from the service  
281 back to the client, or where the service might respond to the client some time after the original  
282 request has completed.

283 The following example shows a scenario in which bidirectional interfaces and callbacks could be  
284 used. A client requests a quotation from a supplier. To process the enquiry and return the  
285 quotation, some suppliers might need additional information from the client. The client does not

286 know which additional items of information will be needed by different suppliers. This interaction  
287 can be modeled as a bidirectional interface with callback requests to obtain the additional  
288 information.

```
289 package somepackage;
290 import org.osoa.sca.annotation.Callback;
291 import org.osoa.sca.annotation.Remotable;
292 @Remotable
293 @Callback(QuotationCallback.class)
294 public interface Quotation {
295     double requestQuotation(String productCode, int quantity);
296 }
297
298 @Remotable
299 public interface QuotationCallback {
300     String getState();
301     String getZipCode();
302     String getCreditRating();
303 }
304
```

305 In this example, the `requestQuotation` operation requests a quotation to supply a given quantity  
306 of a specified product. The `QuotationCallback` interface provides a number of operations that the  
307 supplier can use to obtain additional information about the client making the request. For  
308 example, some suppliers might quote different prices based on the state or the zip code to which  
309 the order will be shipped, and some suppliers might quote a lower price if the ordering company  
310 has a good credit rating. Other suppliers might quote a standard price without requesting any  
311 additional information from the client.

312 The following code snippet illustrates a possible implementation of the example service, using the  
313 `@Callback` annotation to request that a callback proxy be injected.

```
314 @Callback
315 protected QuotationCallback callback;
316
317 public double requestQuotation(String productCode, int quantity) {
318     double price = getPrice(productCode, quantity);
319     double discount = 0;
320     if (quantity > 1000 && callback.getState().equals("FL")) {
321         discount = 0.05;
322     }
323     if (quantity > 10000 && callback.getCreditRating().charAt(0) == 'A') {
324         discount += 0.05;
325     }
326     return price * (1-discount);
327 }
328
329
```

330 The code snippet below is taken from the client of this example service. The client's service  
331 implementation class implements the methods of the `QuotationCallback` interface as well as those  
332 of its own service interface `ClientService`.

```
333 public class ClientImpl implements ClientService, QuotationCallback {
334
335     private QuotationService myService;
336
337     @Reference
338     public void setMyService(QuotationService service) {
339         myService = service;
340     }
341 }

```

```

342
343     public void aClientMethod() {
344         ...
345         double quote = myService.requestQuotation("AB123", 2000);
346         ...
347     }
348
349     public String getState() {
350         return "TX";
351     }
352     public String getZipCode() {
353         return "78746";
354     }
355     public String getCreditRating() {
356         return "AA";
357     }
358 }
359

```

360 In this example the callback is *stateless*, i.e., the callback requests do not need any information  
361 relating to the original service request. For a callback that needs information relating to the  
362 original service request (a *stateful* callback), this information can be passed to the client by the  
363 service provider as parameters on the callback request..

## 364 6.2.2 Callback Instance Management

365 Instance management for callback requests received by the client of the bidirectional service is  
366 handled in the same way as instance management for regular service requests. If the client  
367 implementation has STATELESS scope, the callback is dispatched using a newly initialized  
368 instance. If the client implementation has COMPOSITE scope, the callback is dispatched using the  
369 same shared instance that is used to dispatch regular service requests.

370 As described in section 6.7.1, a stateful callback can obtain information relating to the original  
371 service request from parameters on the callback request. Alternatively, a composite-scoped client  
372 could store information relating to the original request as instance data and retrieve it when the  
373 callback request is received. These approaches could be combined by using a key passed on the  
374 callback request (e.g., an order ID) to retrieve information that was stored in a composite-scoped  
375 instance by the client code that made the original request.

## 376 6.2.3 Implementing Multiple Bidirectional Interfaces

377 Since it is possible for a single implementation class to implement multiple services, it is also  
378 possible for callbacks to be defined for each of the services that it implements. The service  
379 implementation can include an injected field for each of its callbacks. The runtime injects the  
380 callback onto the appropriate field based on the type of the callback. The following shows the  
381 declaration of two fields, each of which corresponds to a particular service offered by the  
382 implementation.

```

383
384 @Callback
385 protected MyService1Callback callback1;
386
387 @Callback
388 protected MyService2Callback callback2;
389

```

390 If a single callback has a type that is compatible with multiple declared callback fields, then all of  
391 them will be set.

## 392 6.2.4 Accessing Callbacks

393 In addition to injecting a reference to a callback service, it is also possible to obtain a reference to  
394 a Callback instance by annotating a field or method of type **ServiceReference** with the  
395 **@Callback** annotation.

396 A reference implementing the callback service interface may can be obtained using  
397 `ServiceReference.getService()`.

398 The following example fragments come from a service implementation that uses the callback API:

```
400 @Callback  
401 protected ServiceReference<MyCallback> callback;  
402  
403 public void someMethod() {  
404     MyCallback myCallback = callback.getCallback();    ...  
405     myCallback.receiveResult(theResult);  
406 }  
407  
408  
409  
410
```

411 Because ServiceReference objects are serializable, they can be stored persistently and retrieved at  
412 a later time to make a callback invocation after the associated service request has completed.  
413 ServiceReference objects can also be passed as parameters on service invocations, enabling the  
414 responsibility for making the callback to be delegated to another service.

415 Alternatively, a callback may can be retrieved programmatically using the **RequestContext** API.  
416 The snippet below shows how to retrieve a callback in a method programmatically:

```
417 public void someMethod() {  
418     MyCallback myCallback =  
419         ComponentContext.getRequestContext().getCallback();  
420     ...  
421     myCallback.receiveResult(theResult);  
422 }  
423  
424  
425  
426
```

427 On the client side, the service that implements the callback can access the callback ID that was  
428 returned with the callback operation by accessing the request context, as follows:

```
429 @Context  
430 protected RequestContext requestContext;  
431  
432 void receiveResult(Object theResult) {  
433     Object refParams =  
434         requestContext.getServiceReference().getCallbackID();  
435     ...  
436 }  
437
```

438 This is necessary if the service implementation has COMPOSITE scope, because callback injection  
439 is not performed for composite-scoped implementations.  
440

441

## 7 Policy Annotations for Java

442  
443  
444  
445  
446

SCA provides facilities for the attachment of policy-related metadata to SCA assemblies, which influence how implementations, services and references behave at runtime. The policy facilities are described in [the SCA Policy Framework specification \[POLICY\]](#). In particular, the facilities include Intents and Policy Sets, where intents express abstract, high-level policy requirements and policy sets express low-level detailed concrete policies.

447  
448  
449  
450

Policy metadata can be added to SCA assemblies through the means of declarative statements placed into Composite documents and into Component Type documents. These annotations are completely independent of implementation code, allowing policy to be applied during the assembly and deployment phases of application development.

451  
452  
453  
454  
455  
456  
457  
458

However, it can be useful and more natural to attach policy metadata directly to the code of implementations. This is particularly important where the policies concerned are relied on by the code itself. An example of this from the Security domain is where the implementation code expects to run under a specific security Role and where any service operations invoked on the implementation must be authorized to ensure that the client has the correct rights to use the operations concerned. By annotating the code with appropriate policy metadata, the developer can rest assured that this metadata is not lost or forgotten during the assembly and deployment phases.

459  
460  
461  
462  
463

The SCA Java Common Annotations specification provides a series of annotations which provide the capability for the developer to attach policy information to Java implementation code. The annotations concerned first provide general facilities for attaching SCA Intents and Policy Sets to Java code. Secondly, there are further specific annotations that deal with particular policy intents for certain policy domains such as Security.

464  
465  
466  
467

The SCA Java Common Annotations specification supports using [the Common Annotation for Java Platform specification \(JSR-250\) \[JSR-250\]](#). An implication of adopting the common annotation for Java platform specification is that the SCA Java specification support consistent annotation and Java class inheritance relationships.

468

469

### 7.1 General Intent Annotations

470  
471

SCA provides the annotation **@Requires** for the attachment of any intent to a Java class, to a Java interface or to elements within classes and interfaces such as methods and fields.

472

The @Requires annotation can attach one or multiple intents in a single statement.

473  
474  
475

Each intent is expressed as a string. Intents are XML QNames, which consist of a Namespace URI followed by the name of the Intent. The precise form used follows the string representation used by the javax.xml.namespace.QName class, which is as follows:

476

```
"{" + Namespace URI + "}" + intentname
```

477  
478

Intents can be qualified, in which case the string consists of the base intent name, followed by a ".", followed by the name of the qualifier. There can also be multiple levels of qualification.

479  
480  
481

This representation is quite verbose, so we expect that reusable String constants will be defined for the namespace part of this string, as well as for each intent that is used by Java code. SCA defines constants for intents such as the following:

482  
483  
484  
485  
486

```
public static final String SCA_PREFIX=  
    "{http://docs.oasis-open.org/ns/opencsa/sca/200712}";  
public static final String CONFIDENTIALITY = SCA_PREFIX + "confidentiality";  
public static final String CONFIDENTIALITY_MESSAGE = CONFIDENTIALITY + ".message";
```

487 Notice that, by convention, qualified intents include the qualifier as part of the name of the  
488 constant, separated by an underscore. These intent constants are defined in the file that defines  
489 an annotation for the intent (annotations for intents, and the formal definition of these constants,  
490 are covered in a following section).

491 Multiple intents (qualified or not) are expressed as separate strings within an array declaration.

492 An example of the @Requires annotation with 2 qualified intents (from the Security domain)  
493 follows:

```
494     @Requires({CONFIDENTIALITY_MESSAGE, INTEGRITY_MESSAGE})
```

495

496 This attaches the intents "confidentiality.message" and "integrity.message".

497 The following is an example of a reference requiring support for confidentiality:

```
498     package com.foo;
499
500     import static org.oasisopen.sca.annotation.Confidentiality.*;
501     import static org.oasisopen.sca.annotation.Reference;
502     import static org.oasisopen.sca.annotation.Requires;
503
504
505     public class Foo {
506         @Requires(CONFIDENTIALITY)
507         @Reference
508         public void setBar(Bar bar) {
509             ...
510         }
511     }
```

513 Users can also choose to only use constants for the namespace part of the QName, so that they  
514 can add new intents without having to define new constants. In that case, this definition would  
515 instead look like this:

```
516     package com.foo;
517
518     import static org.oasisopen.sca.Constants.*;
519     import static org.oasisopen.sca.annotation.Reference;
520     import static org.oasisopen.sca.annotation.Requires;
521
522     public class Foo {
523         @Requires(SCA_PREFIX+"confidentiality")
524         @Reference
525         public void setBar(Bar bar) {
526             ...
527         }
528     }
```

530 The formal syntax for the @Requires annotation follows:

```
531     @Requires( "qualifiedIntent" (, "qualifiedIntent")* )
```

532 where

```
533     qualifiedIntent ::= QName(.qualifier)*
```

534

535 See [section @Requires](#) for the formal definition of the @Requires annotation.

## 536 7.2 Specific Intent Annotations

537 In addition to the general intent annotation supplied by the @Requires annotation described  
538 above, it is also possible to have Java annotations that correspond to specific policy intents. SCA  
539 provides a number of these specific intent annotations and it is also possible to create new specific  
540 intent annotations for any intent.

541 The general form of these specific intent annotations is an annotation with a name derived from  
542 the name of the intent itself. If the intent is a qualified intent, qualifiers are supplied as an  
543 attribute to the annotation in the form of a string or an array of strings.

544 For example, the SCA confidentiality intent described in [the section on General Intent Annotations](#)  
545 using the @Requires(CONFIDENTIALITY) intent can also be specified with the specific  
546 @Confidentiality intent annotation. The specific intent annotation for the "integrity" security intent  
547 is:

```
548 @Integrity
```

549 An example of a qualified specific intent for the "authentication" intent is:

```
550 @Authentication( {"message", "transport"} )
```

551 This annotation attaches the pair of qualified intents: "authentication.message" and  
552 "authentication.transport" (the sca: namespace is assumed in this both of these cases –  
553 "http://docs.oasis-open.org/ns/opencsa/sca/200712").

554 The general form of specific intent annotations is:

```
555 @<Intent>[(qualifiers)]
```

556 where Intent is an NCName that denotes a particular type of intent.

```
557 Intent ::= NCName  
558 qualifiers ::= "qualifier" (, "qualifier")*  
559 qualifier ::= NCName(qualifier)?  
560
```

### 561 7.2.1 How to Create Specific Intent Annotations

562 SCA identifies annotations that correspond to intents by providing an @Intent annotation which  
563 must be used in the definition of an intent annotation.

564 The @Intent annotation takes a single parameter, which (like the @Requires annotation) is the  
565 String form of the QName of the intent. As part of the intent definition, it is good practice  
566 (although not required) to also create String constants for the Namespace, the Intent and for  
567 Qualified versions of the Intent (if defined). These String constants are then available for use with  
568 the @Requires annotation and it is also possible to use one or more of them as parameters to the  
569 specific intent annotation.

570 Alternatively, the QName of the intent can be specified using separate parameters for the  
571 targetNamespace and the localPart for example:

```
572 @Intent(targetNamespace=SCA_NS, localPart="confidentiality").
```

573 See [section @Intent](#) for the formal definition of the @Intent annotation.

574 When an intent can be qualified, it is good practice for the first attribute of the annotation to be a  
575 string (or an array of strings) which holds one or more qualifiers.

576 In this case, the attribute's definition should be marked with the @Qualifier annotation. The  
577 @Qualifier tells SCA that the value of the attribute should be treated as a qualifier for the intent  
578 represented by the whole annotation. If more than one qualifier value is specified in an  
579 annotation, it means that multiple qualified forms are required. For example:

```
580 @Confidentiality({"message", "transport"})
```

581 implies that both of the qualified intents "confidentiality.message" and "confidentiality.transport"  
582 are set for the element to which the confidentiality intent is attached.

583 See section @Qualifier for the formal definition of the @Qualifier annotation.

584 Examples of the use of the @Intent and the @Qualifier annotations in the definition of specific  
585 intent annotations are shown in [the section dealing with Security Interaction Policy](#).

## 586 7.3 Application of Intent Annotations

587 The SCA Intent annotations can be applied to the following Java elements:

- 588 • Java class
- 589 • Java interface
- 590 • Method
- 591 • Field
- 592 • Constructor parameter

593 Where multiple intent annotations (general or specific) are applied to the same Java element, they  
594 are additive in effect. An example of multiple policy annotations being used together follows:

```
595 @Authentication  
596 @Requires({CONFIDENTIALITY_MESSAGE, INTEGRITY_MESSAGE})
```

597 In this case, the effective intents are "authentication", "confidentiality.message" and  
598 "integrity.message".

599 If an annotation is specified at both the class/interface level and the method or field level, then  
600 the method or field level annotation completely overrides the class level annotation of the same  
601 base intent name.

602 The intent annotation can be applied either to classes or to class methods when adding annotated  
603 policy on SCA services. Applying an intent to the setter method in a reference injection approach  
604 allows intents to be defined at references.

### 605 7.3.1 Inheritance And Annotation

606 The inheritance rules for annotations are consistent with the common annotation specification, JSR  
607 250.

608 The following example shows the inheritance relations of intents on classes, operations, and super  
609 classes.

```
610 package services.hello;  
611 import org.oasisopen.sca.annotation.Remotable;  
612 import org.oasisopen.sca.annotation.Integrity;  
613 import org.oasisopen.sca.annotation.Authentication;  
614  
615 @Integrity("transport")  
616 @Authentication  
617 public class HelloService {  
618     @Integrity  
619     @Authentication("message")  
620     public String hello(String message) {...}  
621  
622     @Integrity  
623     @Authentication("transport")  
624     public String helloThere() {...}  
625 }  
626  
627 package services.hello;  
628 import org.oasisopen.sca.annotation.Remotable;  
629 import org.oasisopen.sca.annotation.Confidentiality;  
630 import org.oasisopen.sca.annotation.Authentication;
```

```

631
632     @Confidentiality("message")
633     public class HelloChildService extends HelloService {
634         @Confidentiality("transport")
635         public String hello(String message) {...}
636         @Authentication
637         String helloWorld() {...}
638     }

```

639 Example 2a. Usage example of annotated policy and inheritance.

640

641 The effective intent annotation on the helloWorld method is Integrity("transport"),  
642 @Authentication, and @Confidentiality("message").

643 The effective intent annotation on the hello method of the HelloChildService is  
644 @Integrity("transport"), @Authentication, and @Confidentiality("transport"),

645 The effective intent annotation on the helloThere method of the HelloChildService is @Integrity  
646 and @Authentication("transport"), the same as in HelloService class.

647 The effective intent annotation on the hello method of the HelloService is @Integrity and  
648 @Authentication("message")

649

650 The listing below contains the equivalent declarative security interaction policy of the HelloService  
651 and HelloChildService implementation corresponding to the Java interfaces and classes shown in  
652 Example 2a.

653

```

654 <?xml version="1.0" encoding="ASCII"?>
655 <composite xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200712"
656           name="HelloServiceComposite" >
657     <service name="HelloService" requires="integrity/transport
658           authentication">
659       ...
660     </service>
661     <service name="HelloChildService" requires="integrity/transport
662           authentication confidentiality/message">
663       ...
664     </service>
665     ...
666
667     <component name="HelloServiceComponent">*
668       <implementation.java class="services.hello.HelloService"/>
669       <operation name="hello" requires="integrity
670             authentication/message"/>
671       <operation name="helloThere"
672             requires="integrity
673             authentication/transport"/>
674     </component>
675     <component name="HelloChildServiceComponent">*
676       <implementation.java
677             class="services.hello.HelloChildService" />
678       <operation name="hello"
679             requires="confidentiality/transport"/>
680       <operation name="helloThere" requires="integrity/transport
681             authentication"/>
682       <operation name="helloWorld" requires="authentication"/>
683     </component>
684

```

```
685     ...
686
687     </composite>
```

688 Example 2b. Declaratives intents equivalent to annotated intents in Example 2a.

690

## 691 7.4 Relationship of Declarative And Annotated Intents

692 Annotated intents on a Java class cannot be overridden by declarative intents in a composite  
693 document which uses the class as an implementation. This rule follows the general rule for intents  
694 that they represent requirements of an implementation in the form of a restriction that cannot be  
695 relaxed.

696 However, a restriction can be made more restrictive so that an unqualified version of an intent  
697 expressed through an annotation in the Java class can be qualified by a declarative intent in a  
698 using composite document.

## 699 7.5 Policy Set Annotations

700 The SCA Policy Framework uses Policy Sets to capture detailed low-level concrete policies (for  
701 example, a concrete policy is the specific encryption algorithm to use when encrypting messages  
702 when using a specific communication protocol to link a reference to a service).

703 Policy Sets can be applied directly to Java implementations using the **@PolicySets** annotation.  
704 The @PolicySets annotation either takes the QName of a single policy set as a string or the name  
705 of two or more policy sets as an array of strings:  
706

```
707     @PolicySets( "<policy set QName>" |
708               { "<policy set QName>" [, "<policy set QName>"] })
```

709

710 As for intents, PolicySet names are QNames – in the form of "{Namespace-URI}localPart".

711 An example of the @PolicySets annotation:

712

```
713     @Reference(name="helloService", required=true)
714     @PolicySets({ MY_NS + "WS_Encryption_Policy",
715                MY_NS + "WS_Authentication_Policy" })
716     public setHelloService(HelloService service) {
717         . . .
718     }
719
```

720 In this case, the Policy Sets WS\_Encryption\_Policy and WS\_Authentication\_Policy are applied, both  
721 using the namespace defined for the constant MY\_NS.

722 PolicySets must satisfy intents expressed for the implementation when both are present, according  
723 to the rules defined in [the Policy Framework specification \[POLICY\]](#).

724 The SCA Policy Set annotation can be applied to the following Java elements:

- 725 • Java class
- 726 • Java interface
- 727 • Method
- 728 • Field
- 729 • Constructor parameter

## 730 7.6 Security Policy Annotations

731 This section introduces annotations for SCA's security intents, as defined in [the SCA Policy](#)  
732 [Framework specification \[POLICY\]](#).

### 733 7.6.1 Security Interaction Policy

734 The following interaction policy Intents and qualifiers are defined for Security Policy, which apply  
735 to the operation of services and references of an implementation:

- 736 • @Integrity
- 737 • @Confidentiality
- 738 • @Authentication

739 All three of these intents have the same pair of Qualifiers:

- 740 • message
- 741 • transport

742 The formal definitions of the @Authentication, @Confidentiality and @Integrity annotations are  
743 found in the sections [@Authentication](#), [@Confidentiality](#) and [@Integrity](#).

744 The following example shows an example of applying an intent to the setter method used to inject  
745 a reference. Accessing the hello operation of the referenced HelloService requires both  
746 "integrity.message" and "authentication.message" intents to be honored.

```
747
748 package services.hello;
749 //Interface for HelloService
750 public interface HelloService {
751     String hello(String helloMsg);
752 }
753
754 package services.client;
755 // Interface for ClientService
756 public interface ClientService {
757     public void clientMethod();
758 }
759
760 // Implementation class for ClientService
761 package services.client;
762
763 import services.hello.HelloService;
764 import org.oasisopen.sca.annotation.*;
765
766 @Service(ClientService.class)
767 public class ClientServiceImpl implements ClientService {
768
769     private HelloService helloService;
770
771     @Reference(name="helloService", required=true)
772     @Integrity("message")
773     @Authentication("message")
774     public void setHelloService(HelloService service) {
775         helloService = service;
776     }
777
778     public void clientMethod() {
779         String result = helloService.hello("Hello World!");
```

```
780     ...
781     }
782 }
783
```

784 Example 1. Usage of annotated intents on a reference.

## 785 7.6.2 Security Implementation Policy

786 SCA defines java implementation honors the set ~~a number~~ of security policy annotations that  
787 apply as policies to implementations themselves. These annotations mostly have to do with  
788 authorization and security identity. The following authorization and security identity annotations  
789 (as defined in JSR 250) are supported:

- 790 RunAs

791 Takes as a parameter a string which is the name of a Security role.  
792 eg. @RunAs("Manager")  
793

794 Code marked with this annotation will execute with the Security permissions of the  
795 identified role. [The @RunAs annotations can be mapped to <runAs> element that is defined in the](#)  
796 [policy specification. Any code so annotated will run with the permissions of that role. How runAs role](#)  
797 [names are mapped to security principals is implementation dependent.](#)  
798 [E.g. the above @RunAs annotation can be mapped as if the following policySet is defined and attached](#)  
799 [to the level where the annotation applies:](#)

```
800 <policySet name="runas_manager">
801   <securityIdentity>
802     <runAs role="Manager">
803     </securityIdentity>
804 </policySet>
805
```

- 806 RolesAllowed

807  
808 Takes as a parameter a single string or an array of strings which represent one or more  
809 role names. When present, the implementation can only be accessed by principals whose  
810 role corresponds to one of the role names listed in the @roles attribute. How role names  
811 are mapped to security principals is implementation dependent (SCA does not define this).  
812 eg. @RolesAllowed( {"Manager", "Employee"} )

813 [The @RolesAllowed annotation can be mapped to <allow> element that is defined in](#)  
814 [the policy specification. It indicates that access is granted only to principals whose role](#)  
815 [corresponds to one of the role names listed in the @roles attribute. How role names are](#)  
816 [mapped to security principals is SCA Runtime implementation dependent. E.g. the above](#)  
817 [@RolesAllowed annotation can be mapped as if the following policySet is defined and](#)  
818 [attached to the level where the annotation applies:](#)

```
819 <policySet name="allow_manager_employee">
820   <authorization>
821     <allow roles="Manager Employee">
822     </authorization>
823 </policySet>
824
```

- 825 PermitAll

826 No parameters. When present, grants access to all roles.  
827

828 [The @PermitAll annotation can be mapped to <permitAll> element that is defined in](#)  
829 [the policy specification. It indicates to grant access to all principals respectively. E.g a](#)  
830 [@PermitAll annotation can be mapped as if the following policySet is defined and attached](#)  
831 [to the level where the annotation applies:](#)

```
832 <policySet name="permitAll">
833   <authorization>
834     <permitAll/>

```

879  
880  
881  
882  
883

```
    </authorization>  
  </policySet>
```

- DenyAll

No parameters. When present, denies access to all roles.

[The @DenyAll annotation can be mapped to <denyAll> element that is defined in the policy specification. It indicates to deny access to all principals respectively. E.g a @DenyAll annotation can be mapped as if the following policySet is defined and attached to the level where the annotation applies:](#)

```
  <policySet name="denyAll">  
    <authorization>  
      <denyAll/>  
    </authorization>  
  </policySet>
```

- DeclareRoles

Takes as a parameter a string or an array of strings which identify one or more role names that form the set of roles used by the implementation.  
eg. @DeclareRoles({"Manager", "Employee", "Customer"})

[There is no mapping to elements defined in policy specifications.](#)

(all these are declared in the Java package javax.annotation.security)

[None of these annotations will appear in the introspected componentType definitions, therefore, these policies are Java implementation specific policies which only Java implementation implementers needs to deal with. When assembly model defines policies it will over-write the java annotations on the implementation class.](#)

For a full explanation of these intents, see [the Policy Framework specification \[POLICY\]](#).

### 7.6.2.1 Annotated Implementation Policy Example

The following is an example showing annotated security implementation policy:

```
package services.account;  
@Remotable  
public interface AccountService {  
    AccountReport getAccountReport(String customerID);  
    float fromUSDollarToCurrency(float value);  
}
```

The following is a full listing of the AccountServiceImpl class, showing the Service it implements, plus the service references it makes and the settable properties that it has, along with a set of implementation policy annotations:

```
package services.account;  
import java.util.List;  
import commonj.sdo.DataFactory;  
import org.oasisopen.sca.annotation.Property;
```

Formatted: Indent: Left: 0.25", No bullets or numbering

Formatted: Font: Verdana

Formatted: Normal, Indent: Left: 0.75", No bullets or numbering, Don't adjust space between Latin and Asian text

Formatted: Indent: Left: 0.25", No bullets or numbering

Formatted

```

884 import org.oasisopen.sca.annotation.Reference;
885 import
886 org.oasisopen.sca.annotation.javax.annotation.security.RolesAllowed;
887 import javax.annotation.security.org.oasisopen.sca.annotation.RunAs;
888 import javax.annotation.security.org.oasisopen.sca.annotation.PermitAll;
889 import services.accountdata.AccountDataService;
890 import services.accountdata.CheckingAccount;
891 import services.accountdata.SavingsAccount;
892 import services.accountdata.StockAccount;
893 import services.stockquote.StockQuoteService;
894 @RolesAllowed("customers")
895 @RunAs("accountants")
896 public class AccountServiceImpl implements AccountService {
897
898     @Property
899     protected String currency = "USD";
900
901     @Reference
902     protected AccountDataService accountDataService;
903     @Reference
904     protected StockQuoteService stockQuoteService;
905
906     @RolesAllowed({"customers", "accountants"})
907     public AccountReport getAccountReport(String customerID) {
908
909         DataFactory dataFactory = DataFactory.INSTANCE;
910         AccountReport accountReport =
911             (AccountReport) dataFactory.create(AccountReport.class);
912         List accountSummaries = accountReport.getAccountSummaries();
913
914         CheckingAccount checkingAccount =
915             accountDataService.getCheckingAccount(customerID);
916         AccountSummary checkingAccountSummary =
917             (AccountSummary) dataFactory.create(AccountSummary.class);
918
919         checkingAccountSummary.setAccountNumber(checkingAccount.getAccountNumber()
920 );
921         checkingAccountSummary.setAccountType("checking");
922         checkingAccountSummary.setBalance(fromUSDollarToCurrency
923             (checkingAccount.getBalance()));
924         accountSummaries.add(checkingAccountSummary);
925
926         SavingsAccount savingsAccount =
927             accountDataService.getSavingsAccount(customerID);
928         AccountSummary savingsAccountSummary =
929             (AccountSummary) dataFactory.create(AccountSummary.class);
930
931         savingsAccountSummary.setAccountNumber(savingsAccount.getAccountNumber());
932         savingsAccountSummary.setAccountType("savings");
933         savingsAccountSummary.setBalance(fromUSDollarToCurrency
934             (savingsAccount.getBalance()));
935         accountSummaries.add(savingsAccountSummary);
936
937         StockAccount stockAccount =
938             accountDataService.getStockAccount(customerID);
939         AccountSummary stockAccountSummary =
940             (AccountSummary) dataFactory.create(AccountSummary.class);
941         stockAccountSummary.setAccountNumber(stockAccount.getAccountNumber());

```

```

942     stockAccountSummary.setAccountType("stock");
943     float balance= (stockQuoteService.getQuote(stockAccount.getSymbol())) *
944                   stockAccount.getQuantity();
945     stockAccountSummary.setBalance(fromUSDollarToCurrency(balance));
946     accountSummaries.add(stockAccountSummary);
947
948     return accountReport;
949 }
950
951 @PermitAll
952 public float fromUSDollarToCurrency(float value) {
953
954     if (currency.equals("USD")) return value; else
955     if (currency.equals("EURO")) return value * 0.8f; else
956     return 0.0f;
957 }
958 }

```

959 Example 3. Usage of annotated security implementation policy for the java language.

960 In this example, the implementation class as a whole is marked:

- 961 • @RolesAllowed("customers") - indicating that customers have access to the
- 962 implementation as a whole
- 963 • @RunAs("accountants") - indicating that the code in the implementation runs with the
- 964 permissions of accountants

965 The getAccountReport(..) method is marked with @RolesAllowed({"customers", "accountants"}),  
966 which indicates that this method can be called by both customers and accountants.

967 The fromUSDollarToCurrency() method is marked with @PermitAll, which means that this method  
968 can be called by any role.

---

## 969 78 Java API

970 This section provides a reference for the Java API offered by SCA.

### 971 7.18.1 Component Context

972 The following Java code defines the *ComponentContext* interface:

973

```
974 package org.oasisopen.sca;
```

975

```
976 public interface ComponentContext {
```

977

```
978     String getURI();
```

979

```
980     <B> B getService(Class<B> businessInterface, String referenceName);
```

981

```
982     <B> ServiceReference<B> getServiceReference(Class<B> businessInterface,  
983                                             String referenceName);
```

984

```
984     <B> Collection<B> getServices(Class<B> businessInterface,  
985                                String referenceName);
```

986

```
987     <B> Collection<ServiceReference<B>> getServiceReferences(Class<B>  
988                                                            businessInterface, String referenceName);
```

989

```
990     <B> ServiceReference<B> createSelfReference(Class<B>  
991                                                businessInterface);
```

992

```
993     <B> ServiceReference<B> createSelfReference(Class<B> businessInterface,  
994                                               String serviceName);
```

995

```
996     <B> B getProperty(Class<B> type, String propertyName);
```

997

```
998     <B, R extends ServiceReference<B>> R cast(B target)  
999                                     throws IllegalArgumentException;
```

1000

```
1001     RequestContext getRequestContext();
```

1002

```
1003
```

```
1004 }
```

1005

1006 • **getURI()** - returns the absolute URI of the component within the SCA domain

1007 • **getService(Class<B> businessInterface, String referenceName)** - Returns a proxy for  
1008 the reference defined by the current component. The getService() method takes as its  
1009 input arguments the Java type used to represent the target service on the client and the  
1010 name of the service reference. It returns an object providing access to the service. The  
1011 returned object implements the Java interface the service is typed with. This method  
1012 MUST throw an IllegalArgumentException if the reference has multiplicity greater than  
1013 one.

1014 • **getServiceReference(Class<B> businessInterface, String referenceName)** - Returns a  
1015 ServiceReference defined by the current component. This method MUST throw an  
1016 IllegalArgumentException if the reference has multiplicity greater than one.

- 1017 • **getServices(Class<B> businessInterface, String referenceName)** – Returns a list of  
1018 typed service proxies for a business interface type and a reference name.
- 1019 • **getServiceReferences(Class<B> businessInterface, String referenceName)** –Returns a  
1020 list typed service references for a business interface type and a reference name.
- 1021 • **createSelfReference(Class<B> businessInterface)** – Returns a ServiceReference that can  
1022 be used to invoke this component over the designated service.
- 1023 • **createSelfReference(Class<B> businessInterface, String serviceName)** – Returns a  
1024 ServiceReference that can be used to invoke this component over the designated service.  
1025 Service name explicitly declares the service name to invoke
- 1026 • **getProperty (Class<B> type, String propertyName)** - Returns the value of an SCA  
1027 property defined by this component.
- 1028 • **getRequestContext()** - Returns the context for the current SCA service request, or null if  
1029 there is no current request or if the context is unavailable. This method MUST return non-  
1030 null when invoked during the execution of a Java business method for a service operation  
1031 or callback operation, on the same thread that the SCA runtime provided, and MUST  
1032 return null in all other cases.
- 1033 • **cast(B target)** - Casts a type-safe reference to a ServiceReference

1034 A component may can access its component context by defining a field or setter method typed by  
1035 **org.oasisopen.sca.ComponentContext** and annotated with **@Context**. To access the target  
1036 service, the component uses **ComponentContext.getService(..)**.

1037 The following shows an example of component context usage in a Java class using the @Context  
1038 annotation.

```
1039 private ComponentContext componentContext;
1040
1041 @Context
1042 public void setContext(ComponentContext context) {
1043     componentContext = context;
1044 }
1045
1046 public void doSomething() {
1047     HelloWorld service =
1048         componentContext.getService(HelloWorld.class, "HelloWorldComponent");
1049     service.hello("hello");
1050 }
1051
```

1052 Similarly, non-SCA client code can use the ComponentContext API to perform operations against a  
1053 component in an SCA domain. How the non-SCA client code obtains a reference to a  
1054 ComponentContext is runtime specific.

## 1055 7.28.2 Request Context

1056 The following shows the **RequestContext** interface:

```
1057
1058 package org.oasisopen.sca;
1059
1060 import javax.security.auth.Subject;
1061
1062 public interface RequestContext {
1063
1064     Subject getSecuritySubject();
1065
1066     String getServiceName();

```

```

1067     <CB> ServiceReference<CB> getCallbackReference();
1068     <CB> CB getCallback();
1069     <B> ServiceReference<B> getServiceReference();
1070
1071 }
1072

```

1073 The RequestContext interface has the following methods:

- 1074 • **getSecuritySubject()** – Returns the JAAS Subject of the current request
- 1075 • **getServiceName()** – Returns the name of the service on the Java implementation the  
1076 request came in on
- 1077 • **getCallbackReference()** – Returns a service reference to the callback as specified by the  
1078 caller. This method returns null when called for a service request whose interface is not  
1079 bidirectional or when called for a callback request.
- 1080 • **getCallback()** – Returns a proxy for the callback as specified by the caller. Similar to the  
1081 getCallbackReference() method, this method returns null when called for a service request  
1082 whose interface is not bidirectional or when called for a callback request.
- 1083 • **getServiceReference()** – When invoked during the execution of a service operation, this  
1084 method MUST return a ServiceReference that represents the service that was invoked.  
1085 When invoked during the execution of a callback operation, this method MUST return a  
1086 CallableReference that represents the callback that was invoked.

### 1087 7.38.3 ServiceReference

1088 ServiceReferences may can be injected using the @Reference annotation on a field, a setter  
1089 method, or constructor parameter taking the type ServiceReference. The detailed description of  
1090 the usage of these methods is described in the section on Asynchronous Programming in this  
1091 document.

1092 The following Java code defines the **ServiceReference** interface:

```

1093 package org.oasisopen.sca;
1094
1095 public interface ServiceReference<B> extends java.io.Serializable {
1096
1097     B getService();
1098     Class<B> getBusinessInterface();
1099 }
1100

```

1101 The ServiceReference interface has the following methods:

- 1102
- 1103 • **getService()** - Returns a type-safe reference to the target of this reference. The instance  
1104 returned is guaranteed to implement the business interface for this reference. The value  
1105 returned is a proxy to the target that implements the business interface associated with this  
1106 reference.
- 1107 • **getBusinessInterface()** – Returns the Java class for the business interface associated with  
1108 this reference.

### 1109 7.48.4 ServiceRuntimeException

1110 The following snippet shows the **ServiceRuntimeException**.

```

1111
1112 package org.oasisopen.sca;
1113

```

```
1114 public class ServiceRuntimeException extends RuntimeException {
1115     ...
1116 }
```

1117 This exception signals problems in the management of SCA component execution.

## 1119 7.58.5 ServiceUnavailableException

1120 The following snippet shows the *ServiceUnavailableException*.

```
1121 package org.oasisopen.sca;
1122
1123 public class ServiceUnavailableException extends ServiceRuntimeException {
1124     ...
1125 }
1126
1127
```

1128 This exception signals problems in the interaction with remote services. These are exceptions that may be transient, so retrying is appropriate. Any exception that is a *ServiceRuntimeException* that is *not* a *ServiceUnavailableException* is unlikely to be resolved by retrying the operation, since it most likely requires human intervention.

## 1132 7.68.6 InvalidServiceException

1133 The following snippet shows the *InvalidServiceException*.

```
1134 package org.oasisopen.sca;
1135
1136 public class InvalidServiceException extends ServiceRuntimeException {
1137     ...
1138 }
1139
1140
```

1141 This exception signals that the *ServiceReference* is no longer valid. This can happen when the target of the reference is undeployed. This exception is not transient and therefore is unlikely to be resolved by retrying the operation and will most likely require human intervention.

## 1144 8.7 Constants Interface

1145 The SCA *Constants* interface defines a number of constant values that are used in the SCA Java APIs and Annotations. The following snippet shows the *Constants* interface:

```
1147 package org.oasisopen.sca;
1148
1149 public interface Constants {
1150     String SCA_NS="http://docs.oasis-open.org/ns/opencsa/sca/200712";
1151     String SCA_PREFIX = "{"+SCA_NS+"}";
1152 }
1153
```

## 1154 89 Java Annotations

1155 This section provides definitions of all the Java annotations which apply to SCA.

1156 This specification places constraints on some annotations that are not detectable by a Java  
1157 compiler. For example, the definition of the @Property and @Reference annotations indicate that  
1158 they are allowed on parameters, but sections 8.14 and 8.15 constrain those definitions to  
1159 constructor parameters. An SCA runtime MUST verify the proper use of all annotations and if an  
1160 annotation is improperly used, the SCA runtime MUST NOT run the component which uses the  
1161 invalid implementation code.

1162 SCA annotations are not allowed on static methods and static fields. It is an error to use an SCA  
1163 annotation on a static method or a static field of an implementation class and the SCA runtime  
1164 MUST NOT instantiate such an implementation class.

### 1165 8.19.1 @AllowsPassByReference

1166 The following Java code defines the *@AllowsPassByReference* annotation:

1167

```
1168 package org.oasisopen.sca.annotation;  
1169  
1170 import static java.lang.annotation.ElementType.TYPE;  
1171 import static java.lang.annotation.ElementType.METHOD;  
1172 import static java.lang.annotation.RetentionPolicy.RUNTIME;  
1173 import java.lang.annotation.Retention;  
1174 import java.lang.annotation.Target;  
1175  
1176 @Target({TYPE, METHOD})  
1177 @Retention(RUNTIME)  
1178 public @interface AllowsPassByReference {  
1179  
1180 }  
1181
```

1182 The *@AllowsPassByReference* annotation is used on implementations of remotable interfaces to  
1183 indicate that interactions with the service from a client within the same address space are allowed  
1184 to use pass by reference data exchange semantics. The implementation promises that its by-value  
1185 semantics will be maintained even if the parameters and return values are actually passed by-  
1186 reference. This means that the service will not modify any operation input parameter or return  
1187 value, even after returning from the operation. Either a whole class implementing a remotable  
1188 service or an individual remotable service method implementation can be annotated using the  
1189 *@AllowsPassByReference* annotation.

1190 *@AllowsPassByReference* has no attributes

1191

1192 The following snippet shows a sample where *@AllowsPassByReference* is defined for the  
1193 implementation of a service method on the Java component implementation class.

1194

```
1195 @AllowsPassByReference  
1196 public String hello(String message) {  
1197     ...  
1198 }
```

## 1199 9.2 @Authentication

1200 The following Java code defines the **@Authentication** annotation:

```
1201 package org.oasisopen.sca.annotation;
1202
1203
1204 import static java.lang.annotation.ElementType.FIELD;
1205 import static java.lang.annotation.ElementType.METHOD;
1206 import static java.lang.annotation.ElementType.PARAMETER;
1207 import static java.lang.annotation.ElementType.TYPE;
1208 import static java.lang.annotation.RetentionPolicy.RUNTIME;
1209 import static org.oasisopen.sca.Constants.SCA_PREFIX;
1210
1211 import java.lang.annotation.Inherited;
1212 import java.lang.annotation.Retention;
1213 import java.lang.annotation.Target;
1214
1215 @Inherited
1216 @Target({TYPE, FIELD, METHOD, PARAMETER})
1217 @Retention(RUNTIME)
1218 @Intent(Authentication.AUTHENTICATION)
1219 public @interface Authentication {
1220     String AUTHENTICATION = SCA_PREFIX + "authentication";
1221     String AUTHENTICATION_MESSAGE = AUTHENTICATION + ".message";
1222     String AUTHENTICATION_TRANSPORT = AUTHENTICATION + ".transport";
1223
1224     /**
1225      * List of authentication qualifiers (such as "message"
1226      * or "transport").
1227      *
1228      * @return authentication qualifiers
1229      */
1230     @Qualifier
1231     String[] value() default "";
1232 }
```

1233 The **@Authentication** annotation is used to indicate that the invocation requires authentication.  
1234 See the [section on Application of Intent Annotations](#) for samples and details.

## 1235 8.29.3 @Callback

1236 The following Java code defines shows the **@Callback** annotation:

```
1237
1238 package org.oasisopen.sca.annotation;
1239
1240 import static java.lang.annotation.ElementType.TYPE;
1241 import static java.lang.annotation.ElementType.METHOD;
1242 import static java.lang.annotation.ElementType.FIELD;
1243 import static java.lang.annotation.RetentionPolicy.RUNTIME;
1244 import java.lang.annotation.Retention;
1245 import java.lang.annotation.Target;
1246
1247 @Target(TYPE, METHOD, FIELD)
1248 @Retention(RUNTIME)
1249 public @interface Callback {
1250
1251     Class<?> value() default Void.class;
```

1252 }  
1253  
1254

The @Callback annotation is used to annotate a service interface with a callback interface, which takes the Java Class object of the callback interface as a parameter.

1257 The @Callback annotation has the following attribute:

- **value** – the name of a Java class file containing the callback interface

1259

1260 The @Callback annotation maycan also be used to annotate a method or a field of an SCA  
1261 implementation class, in order to have a callback object injected

1262

The following snippet shows a @Callback annotation on an interface:

1263

```
1264  
1265 @Remotable  
1266 @Callback(MyServiceCallback.class)  
1267 public interface MyService {  
1268  
1269     void someAsyncMethod(String arg);  
1270 }  
1271
```

1272 An example use of the @Callback annotation to declare a callback interface follows:

1273

```
1274 package somepackage;  
1275 import org.oasisopen.sca.annotation.Callback;  
1276 import org.oasisopen.sca.annotation.Remotable;  
1277 @Remotable  
1278 @Callback(MyServiceCallback.class)  
1279 public interface MyService {  
1280  
1281     void someMethod(String arg);  
1282 }  
1283  
1284 @Remotable  
1285 public interface MyServiceCallback {  
1286  
1287     void receiveResult(String result);  
1288 }  
1289
```

1289

In this example, the implied component type is:

1291

```
1292 <componentType xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200712" >  
1293  
1294     <service name="MyService">  
1295         <interface.java interface="somepackage.MyService"  
1296             callbackInterface="somepackage.MyServiceCallback"/>  
1297     </service>  
1298 </componentType>
```

### 1299 8.39.4 @ComponentName

1300 The following Java code defines the @ComponentName annotation:

```

1301
1302 package org.oasisopen.sca.annotation;
1303
1304 import static java.lang.annotation.ElementType.METHOD;
1305 import static java.lang.annotation.ElementType.FIELD;
1306 import static java.lang.annotation.RetentionPolicy.RUNTIME;
1307 import java.lang.annotation.Retention;
1308 import java.lang.annotation.Target;
1309
1310 @Target({METHOD, FIELD})
1311 @Retention(RUNTIME)
1312 public @interface ComponentName {
1313
1314 }
1315

```

1316 The @ComponentName annotation is used to denote a Java class field or setter method that is  
1317 used to inject the component name.

1318 The following snippet shows a component name field definition sample.

```

1319
1320 @ComponentName
1321 private String componentName;
1322

```

1323 The following snippet shows a component name setter method sample.

```

1324
1325 @ComponentName
1326 public void setComponentName(String name) {
1327     //...
1328 }

```

## 1329 9.5 @Confidentiality

1330 The following Java code defines the **@Confidentiality** annotation:

```

1331 package org.oasisopen.sca.annotations;
1332
1333 import static java.lang.annotation.ElementType.FIELD;
1334 import static java.lang.annotation.ElementType.METHOD;
1335 import static java.lang.annotation.ElementType.PARAMETER;
1336 import static java.lang.annotation.ElementType.TYPE;
1337 import static java.lang.annotation.RetentionPolicy.RUNTIME;
1338 import static org.oasisopen.sca.Constants.SCA_PREFIX;
1339
1340 import java.lang.annotation.Inherited;
1341 import java.lang.annotation.Retention;
1342 import java.lang.annotation.Target;
1343
1344 @Inherited
1345 @Target({TYPE, FIELD, METHOD, PARAMETER})
1346 @Retention(RUNTIME)
1347 @Intent(Confidentiality.CONFIDENTIALITY)
1348 public @interface Confidentiality {
1349     String CONFIDENTIALITY = SCA_PREFIX + "confidentiality";
1350     String CONFIDENTIALITY_MESSAGE = CONFIDENTIALITY + ".message";
1351     String CONFIDENTIALITY_TRANSPORT = CONFIDENTIALITY + ".transport";
1352

```

```

1353
1354     /**
1355      * List of confidentiality qualifiers (such as "message" or
1356      * "transport").
1357      *
1358      * @return confidentiality qualifiers
1359      */
1360     @Qualifier
1361     String[] value() default "";
1362 }

```

1363 The **@Confidentiality** annotation is used to indicate that the invocation requires confidentiality.  
1364 See the [section on Application of Intent Annotations](#) for samples and details.

### 1365 8.49.6 @Constructor

1366 The following Java code defines the **@Constructor** annotation:

```

1367 package org.oasisopen.sca.annotation;
1368
1369 import static java.lang.annotation.ElementType.CONSTRUCTOR;
1370 import static java.lang.annotation.RetentionPolicy.RUNTIME;
1371 import java.lang.annotation.Retention;
1372 import java.lang.annotation.Target;
1373
1374 @Target (CONSTRUCTOR)
1375 @Retention (RUNTIME)
1376 public @interface Constructor { }
1377
1378

```

1379 The **@Constructor** annotation is used to mark a particular constructor to use when instantiating a  
1380 Java component implementation. If this constructor has parameters, each of these parameters  
1381 MUST have either a **@Property** annotation or a **@Reference** annotation.

1382 The following snippet shows a sample for the **@Constructor** annotation.

```

1383
1384 public class HelloServiceImpl implements HelloService {
1385
1386     public HelloServiceImpl() {
1387         ...
1388     }
1389
1390     @Constructor
1391     public HelloServiceImpl(@Property(name="someProperty") String
1392     someProperty ){
1393         ...
1394     }
1395
1396     public String hello(String message) {
1397         ...
1398     }
1399 }

```

### 1400 8.59.7 @Context

1401 The following Java code defines the **@Context** annotation:

1402

```

1403 package org.oasisopen.sca.annotation;
1404
1405 import static java.lang.annotation.ElementType.METHOD;
1406 import static java.lang.annotation.ElementType.FIELD;
1407 import static java.lang.annotation.RetentionPolicy.RUNTIME;
1408 import java.lang.annotation.Retention;
1409 import java.lang.annotation.Target;
1410
1411 @Target({METHOD, FIELD})
1412 @Retention(RUNTIME)
1413 public @interface Context {
1414
1415 }
1416

```

1417 The @Context annotation is used to denote a Java class field or a setter method that is used to  
1418 inject a composite context for the component. The type of context to be injected is defined by the  
1419 type of the Java class field or type of the setter method input argument; the type is either  
1420 **ComponentContext** or **RequestContext**.

1421 The @Context annotation has no attributes.

1422

1423 The following snippet shows a ComponentContext field definition sample.

1424

```

1425 @Context
1426 protected ComponentContext context;
1427

```

1428 The following snippet shows a RequestContext field definition sample.

1429

```

1430 @Context
1431 protected RequestContext context;

```

## 1432 8.69.8 @Destroy

1433 The following Java code defines the **@Destroy** annotation:

1434

```

1435 package org.oasisopen.sca.annotation;
1436
1437 import static java.lang.annotation.ElementType.METHOD;
1438 import static java.lang.annotation.RetentionPolicy.RUNTIME;
1439 import java.lang.annotation.Retention;
1440 import java.lang.annotation.Target;
1441
1442 @Target(METHOD)
1443 @Retention(RUNTIME)
1444 public @interface Destroy {
1445
1446 }
1447

```

1448 The @Destroy annotation is used to denote a single Java class method that will be called when the  
1449 scope defined for the implementation class ends. The method MAY have any access modifier and  
1450 MUST have a void return type and no arguments.

1451 If there is a method that matches these criteria, the SCA runtime MUST call the annotated method  
1452 when the scope defined for the implementation class ends. If the implementation class has a

1453 method with an @Destroy annotation that does not match these criteria, the SCA runtime MUST  
1454 NOT instantiate the implementation class.

1455 The following snippet shows a sample for a destroy method definition.

1456

```
1457 @Destroy  
1458 public void myDestroyMethod() {  
1459     ...  
1460 }
```

### 1461 8.79.9 @EagerInit

1462 The following Java code defines the *@EagerInit* annotation:

1463

```
1464 package org.oasisopen.sca.annotation;  
1465  
1466 import static java.lang.annotation.ElementType.TYPE;  
1467 import static java.lang.annotation.RetentionPolicy.RUNTIME;  
1468 import java.lang.annotation.Retention;  
1469 import java.lang.annotation.Target;  
1470  
1471 @Target (TYPE)  
1472 @Retention (RUNTIME)  
1473 public @interface EagerInit {  
1474  
1475 }  
1476
```

1477 The *@EagerInit* annotation is used to annotate the Java class of a COMPOSITE scoped  
1478 implementation for eager initialization. When marked for eager initialization, the composite scoped  
1479 instance is created when its containing component is started.

### 1480 8.89.10 @Init

1481 The following Java code defines the *@Init* annotation:

1482

```
1483 package org.oasisopen.sca.annotation;  
1484  
1485 import static java.lang.annotation.ElementType.METHOD;  
1486 import static java.lang.annotation.RetentionPolicy.RUNTIME;  
1487 import java.lang.annotation.Retention;  
1488 import java.lang.annotation.Target;  
1489  
1490 @Target (METHOD)  
1491 @Retention (RUNTIME)  
1492 public @interface Init {  
1493  
1494 }  
1495  
1496
```

1497 The @Init annotation is used to denote a single Java class method that is called when the scope  
1498 defined for the implementation class starts. The method MAY have any access modifier and MUST  
1499 have a void return type and no arguments.

1500 If there is a method that matches these criteria, the SCA runtime MUST call the annotated method  
1501 after all property and reference injection is complete. If the implementation class has a method

1502 with an @Init annotation that does not match these criteria, the SCA runtime MUST NOT  
1503 instantiate the implementation class.

1504 The following snippet shows an example of an init method definition.

1505

```
1506 @Init  
1507 public void myInitMethod() {  
1508     ...  
1509 }
```

## 1510 9.11 @Integrity

1511 The following Java code defines the **@Integrity** annotation:

1512

```
1513 package org.oasisopen.sca.annotation;  
1514
```

1515

```
1516 import static java.lang.annotation.ElementType.FIELD;  
1517 import static java.lang.annotation.ElementType.METHOD;  
1518 import static java.lang.annotation.ElementType.PARAMETER;  
1519 import static java.lang.annotation.ElementType.TYPE;  
1520 import static java.lang.annotation.RetentionPolicy.RUNTIME;  
1521 import static org.oasisopen.Constants.SCA_PREFIX;
```

1522

```
1523 import java.lang.annotation.Inherited;  
1524 import java.lang.annotation.Retention;  
1525 import java.lang.annotation.Target;
```

1526

```
1527 @Inherited  
1528 @Target({TYPE, FIELD, METHOD, PARAMETER})  
1529 @Retention(RUNTIME)  
1530 @Intent(Integrity.INTEGRITY)
```

1531

```
1532 public @interface Integrity {  
1533     String INTEGRITY = SCA_PREFIX + "integrity";  
1534     String INTEGRITY_MESSAGE = INTEGRITY + ".message";  
1535     String INTEGRITY_TRANSPORT = INTEGRITY + ".transport";
```

1536

```
1537     /**  
1538      * List of integrity qualifiers (such as "message" or "transport").  
1539      * @return integrity qualifiers  
1540      */
```

1541

```
1542     @Qualifier  
1543     String[] value() default "";
```

1544

1545 The **@Integrity** annotation is used to indicate that the invocation requires integrity (ie no  
1546 tampering of the messages between client and service).

1547 See the [section on Application of Intent Annotations](#) for samples and details.

## 1548 9.12 @Intent

1549 The following Java code defines the **@Intent** annotation:

1550

```
1551 package org.osoa.sca.annotation;
```

1552

```
1553 import static java.lang.annotation.ElementType.ANNOTATION_TYPE;
```

```

1553 import static java.lang.annotation.RetentionPolicy.RUNTIME;
1554 import java.lang.annotation.Retention;
1555 import java.lang.annotation.Target;
1556
1557 @Target({ANNOTATION_TYPE})
1558 @Retention(RUNTIME)
1559 public @interface Intent {
1560     /**
1561      * The qualified name of the intent, in the form defined by
1562      * {@link javax.xml.namespace.QName#toString}.
1563      * @return the qualified name of the intent
1564      */
1565     String value() default "";
1566
1567     /**
1568      * The XML namespace for the intent.
1569      * @return the XML namespace for the intent
1570      */
1571     String targetNamespace() default "";
1572
1573     /**
1574      * The name of the intent within its namespace.
1575      * @return name of the intent within its namespace
1576      */
1577     String localPart() default "";
1578 }
1579

```

1580 The @Intent annotation is used for the creation of new annotations for specific intents. It is not  
1581 expected that the @Intent annotation will be used in application code.

1582 See the [section "How to Create Specific Intent Annotations"](#) for details and samples of how to  
1583 define new intent annotations.

### 1584 8.99.13 @OneWay

1585 The following Java code defines the **@OneWay** annotation:

```

1586
1587 package org.oasisopen.sca.annotation;
1588
1589 import static java.lang.annotation.ElementType.METHOD;
1590 import static java.lang.annotation.RetentionPolicy.RUNTIME;
1591 import java.lang.annotation.Retention;
1592 import java.lang.annotation.Target;
1593
1594 @Target (METHOD)
1595 @Retention (RUNTIME)
1596 public @interface OneWay {
1597
1598 }
1599
1600

```

1601 The @OneWay annotation is used on a Java interface or class method to indicate that invocations  
1602 will be dispatched in a non-blocking fashion as described in the section on Asynchronous  
1603 Programming.

1604 The @OneWay annotation has no attributes.

1605 The following snippet shows the use of the @OneWay annotation on an interface.

```

1606 package services.hello;
1607
1608 import org.oasisopen.sca.annotation.OneWay;
1609
1610 public interface HelloService {
1611     @OneWay
1612     void hello(String name);
1613 }

```

## 1614 9.14 @PolicySet

1615 The following Java code defines the **@PolicySets** annotation:

```

1616 package org.oasisopen.sca.annotation;
1617
1618 import static java.lang.annotation.ElementType.FIELD;
1619 import static java.lang.annotation.ElementType.METHOD;
1620 import static java.lang.annotation.ElementType.PARAMETER;
1621 import static java.lang.annotation.ElementType.TYPE;
1622 import static java.lang.annotation.RetentionPolicy.RUNTIME;
1623
1624 import java.lang.annotation.Retention;
1625 import java.lang.annotation.Target;
1626
1627 @Target({TYPE, FIELD, METHOD, PARAMETER})
1628 @Retention(RUNTIME)
1629 public @interface PolicySets {
1630     /**
1631      * Returns the policy sets to be applied.
1632      *
1633      * @return the policy sets to be applied
1634      */
1635     String[] value() default "";
1636 }
1637
1638

```

1639 The **@PolicySet** annotation is used to attach an SCA Policy Set to a Java implementation class or  
1640 to one of its subelements.

1641 See the [section "Policy Set Annotations"](#) for details and samples.

## 1642 8.109.15 @Property

1643 The following Java code defines the **@Property** annotation:

```

1644 package org.oasisopen.sca.annotation;
1645
1646 import static java.lang.annotation.ElementType.METHOD;
1647 import static java.lang.annotation.ElementType.FIELD;
1648 import static java.lang.annotation.ElementType.PARAMETER;
1649 import static java.lang.annotation.RetentionPolicy.RUNTIME;
1650 import java.lang.annotation.Retention;
1651 import java.lang.annotation.Target;
1652
1653 @Target({METHOD, FIELD, PARAMETER})
1654 @Retention(RUNTIME)
1655 public @interface Property {
1656     String name() default "";
1657 }

```

```
1658     boolean required() default true;
1659 }
1660
```

1661 The @Property annotation is used to denote a Java class field, a setter method, or a constructor  
1662 parameter that is used to inject an SCA property value. The type of the property injected, which  
1663 can be a simple Java type or a complex Java type, is defined by the type of the Java class field or  
1664 the type of the input parameter of the setter method or constructor.

1665 The @Property annotation maycan be used on fields, on setter methods or on a constructor  
1666 method parameter. However, the @Property annotation MUST NOT be used on a class field that is  
1667 declared as final.

1668 Properties maycan also be injected via setter methods even when the @Property annotation is not  
1669 present. However, the @Property annotation must be used in order to inject a property onto a  
1670 non-public field. In the case where there is no @Property annotation, the name of the property is  
1671 the same as the name of the field or setter.

1672 Where there is both a setter method and a field for a property, the setter method is used.

1673 The @Property annotation has the following attributes:

- 1674 • **name (optional)** – the name of the property. For a field annotation, the default is the  
1675 name of the field of the Java class. For a setter method annotation, the default is the  
1676 JavaBeans property name [JAVABEANS] corresponding to the setter method name. For a  
1677 constructor parameter annotation, there is no default and the name attribute MUST be  
1678 present.
- 1679 • **required (optional)** – specifies whether injection is required, defaults to true. For a  
1680 constructor parameter annotation, this attribute MUST have the value true.

1681  
1682 The following snippet shows a property field definition sample.

```
1683  
1684 @Property(name="currency", required=true)
1685 protected String currency;
```

1686  
1687 The following snippet shows a property setter sample

```
1688  
1689 @Property(name="currency", required=true)
1690 public void setCurrency( String theCurrency ) {
1691     ....
1692 }
```

1693  
1694 If the property is defined as an array or as any type that extends or implements  
1695 **java.util.Collection**, then the implied component type has a property with a **many** attribute set to  
1696 true.

1697 The following snippet shows the definition of a configuration property using the @Property  
1698 annotation for a collection.

```
1699 ...
1700 private List<String> helloConfigurationProperty;
1701  
1702 @Property(required=true)
1703 public void setHelloConfigurationProperty(List<String> property) {
1704     helloConfigurationProperty = property;
1705 }
```

1706 ...

## 1707 9.16 @Qualifier

1708 The following Java code defines the **@Qualifier** annotation:

```
1709 package org.oasisopen.sca.annotation;
1710
1711 import static java.lang.annotation.ElementType.METHOD;
1712 import static java.lang.annotation.RetentionPolicy.RUNTIME;
1713
1714 import java.lang.annotation.Retention;
1715 import java.lang.annotation.Target;
1716
1717 @Target(METHOD)
1718 @Retention(RUNTIME)
1719 public @interface Qualifier {
1720 }
1721
1722
```

1723 The @Qualifier annotation is applied to an attribute of an intent annotation definition, defined  
1724 using the @Intent annotation, to indicate that the attribute provides qualifiers for the intent. The  
1725 @Qualifier annotation MUST be used in an intent annotation definition where the intent has  
1726 qualifiers.

1727 See the [section "How to Create Specific Intent Annotations"](#) for details and samples of how to  
1728 define new intent annotations.

## 1729 8.119.17 @Reference

1730 The following Java code defines the **@Reference** annotation:

```
1731
1732 package org.oasisopen.sca.annotation;
1733
1734 import static java.lang.annotation.ElementType.METHOD;
1735 import static java.lang.annotation.ElementType.FIELD;
1736 import static java.lang.annotation.ElementType.PARAMETER;
1737 import static java.lang.annotation.RetentionPolicy.RUNTIME;
1738 import java.lang.annotation.Retention;
1739 import java.lang.annotation.Target;
1740 @Target({METHOD, FIELD, PARAMETER})
1741 @Retention(RUNTIME)
1742 public @interface Reference {
1743
1744     String name() default "";
1745     boolean required() default true;
1746 }
1747
```

1748 The @Reference annotation type is used to annotate a Java class field, a setter method, or a  
1749 constructor parameter that is used to inject a service that resolves the reference. The interface of  
1750 the service injected is defined by the type of the Java class field or the type of the input parameter  
1751 of the setter method or constructor.

1752 The @Reference annotation MUST NOT be used on a class field that is declared as final.

1753 References may also be injected via setter methods even when the @Reference annotation is  
1754 not present. However, the @Reference annotation must be used in order to inject a reference  
1755 onto a non-public field. In the case where there is no @Reference annotation, the name of the  
1756 reference is the same as the name of the field or setter.

1757 Where there is both a setter method and a field for a reference, the setter method is used.

1758 The @Reference annotation has the following attributes:

- 1759 • **name (optional)** – the name of the reference. For a field annotation, the default is the  
1760 name of the field of the Java class. For a setter method annotation, the default is the  
1761 JavaBeans property name corresponding to the setter method name. For a constructor  
1762 parameter annotation, there is no default and the name attribute MUST be present.
- 1763 • **required (optional)** – whether injection of service or services is required. Defaults to true.  
1764 For a constructor parameter annotation, this attribute MUST have the value true.

1765

1766 The following snippet shows a reference field definition sample.

1767

```
1768 @Reference(name="stockQuote", required=true)  
1769 protected StockQuoteService stockQuote;
```

1770

1771 The following snippet shows a reference setter sample

1772

```
1773 @Reference(name="stockQuote", required=true)  
1774 public void setStockQuote( StockQuoteService theSQService ) {  
1775     ...  
1776 }  
1777
```

1778 The following fragment from a component implementation shows a sample of a service reference  
1779 using the @Reference annotation. The name of the reference is "helloService" and its type is  
1780 HelloService. The clientMethod() calls the "hello" operation of the service referenced by the  
1781 helloService reference.

1782

```
1783 package services.hello;  
1784  
1785 private HelloService helloService;  
1786  
1787 @Reference(name="helloService", required=true)  
1788 public setHelloService(HelloService service) {  
1789     helloService = service;  
1790 }  
1791  
1792 public void clientMethod() {  
1793     String result = helloService.hello("Hello World!");  
1794     ...  
1795 }  
1796
```

1797 The presence of a @Reference annotation is reflected in the componentType information that the  
1798 runtime generates through reflection on the implementation class. The following snippet shows  
1799 the component type for the above component implementation fragment.

1800

```
1801 <?xml version="1.0" encoding="ASCII"?>  
1802 <componentType xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200712">  
1803     ...  
1804     <!-- Any services offered by the component would be listed here -->
```

```

1805     <reference name="helloService" multiplicity="1..1">
1806         <interface.java interface="services.hello.HelloService"/>
1807     </reference>
1808
1809 </componentType>
1810

```

1811 If the reference is not an array or collection, then the implied component type has a reference  
1812 with a multiplicity of either 0..1 or 1..1 depending on the value of the @Reference **required**  
1813 attribute – 1..1 applies if required=true.

1814  
1815 If the reference is defined as an array or as any type that extends or implements *java.util.Collection*,  
1816 then the implied component type has a reference with a **multiplicity** of either **1..n** or **0..n**, depending  
1817 on whether the **required** attribute of the @Reference annotation is set to true or false – 1..n applies if  
1818 required=true.

1819  
1820 The following fragment from a component implementation shows a sample of a service reference  
1821 definition using the @Reference annotation on a java.util.List. The name of the reference is  
1822 "helloServices" and its type is HelloService. The clientMethod() calls the "hello" operation of all the  
1823 services referenced by the helloServices reference. In this case, at least one HelloService should  
1824 be present, so **required** is true.

```

1825     @Reference(name="helloServices", required=true)
1826     protected List<HelloService> helloServices;
1827
1828     public void clientMethod() {
1829
1830         ...
1831         for (int index = 0; index < helloServices.size(); index++) {
1832             HelloService helloService =
1833                 (HelloService)helloServices.get(index);
1834             String result = helloService.hello("Hello World!");
1835         }
1836         ...
1837     }
1838
1839

```

1840 The following snippet shows the XML representation of the component type reflected from for the  
1841 former component implementation fragment. There is no need to author this component type in  
1842 this case since it can be reflected from the Java class.

```

1843
1844 <?xml version="1.0" encoding="ASCII"?>
1845 <componentType xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200712">
1846
1847     <!-- Any services offered by the component would be listed here -->
1848     <reference name="helloServices" multiplicity="1..n">
1849         <interface.java interface="services.hello.HelloService"/>
1850     </reference>
1851
1852 </componentType>
1853

```

1854 At runtime, the representation of an unwired reference depends on the reference's multiplicity. An  
1855 unwired reference with a multiplicity of 0..1 must be null. An unwired reference with a multiplicity  
1856 of 0..N must be an empty array or collection.

1857 **8.11.19.17.1 Reinjection**

1858 References MAY be reinjected after the initial creation of a component if the reference target  
 1859 changes due to a change in wiring that has occurred since the component was initialized. In order  
 1860 for reinjection to occur, the following MUST be true:

- 1861 1. The component MUST NOT be STATELESS scoped.
- 1862 2. The reference MUST use either field-based injection or setter injection. References that are  
 1863 injected through constructor injection MUST NOT be changed. Setter injection allows for  
 1864 code in the setter method to perform processing in reaction to a change.

1865 If a reference target changes and the reference is not reinjected, the reference MUST continue to  
 1866 work as if the reference target was not changed.

1867 If an operation is called on a reference where the target of that reference has been undeployed,  
 1868 the SCA runtime SHOULD throw InvalidServiceException. If an operation is called on a reference  
 1869 where the target of the reference has become unavailable for some reason, the SCA runtime  
 1870 SHOULD throw ServiceUnavailableException. If the target of the reference is changed, the  
 1871 reference MAY continue to work, depending on the runtime and the type of change that was made.  
 1872 If it doesn't work, the exception thrown will depend on the runtime and the cause of the failure.

1873 A ServiceReference that has been obtained from a reference by ComponentContext.cast()  
 1874 corresponds to the reference that is passed as a parameter to cast(). If the reference is  
 1875 subsequently reinjected, the ServiceReference obtained from the original reference MUST continue  
 1876 to work as if the reference target was not changed. If the target of a ServiceReference has been  
 1877 undeployed, the SCA runtime SHOULD throw InvalidServiceException when an operation is  
 1878 invoked on the ServiceReference. If the target of a ServiceReference has become unavailable, the  
 1879 SCA runtime SHOULD throw ServiceUnavailableException when an operation is invoked on the  
 1880 ServiceReference. If the target of a ServiceReference is changed, the reference MAY continue to  
 1881 work, depending on the runtime and the type of change that was made. If it doesn't work, the  
 1882 exception thrown will depend on the runtime and the cause of the failure.

1883 A reference or ServiceReference accessed through the component context by calling getService()  
 1884 or getServiceReference() MUST correspond to the current configuration of the domain. This  
 1885 applies whether or not reinjection has taken place. If the target has been undeployed or has  
 1886 become unavailable, the result SHOULD be a reference to the undeployed or unavailable service,  
 1887 and attempts to call business methods SHOULD throw an exception as described above. If the  
 1888 target has changed, the result SHOULD be a reference to the changed service.

1889 The rules for reference reinjection also apply to references with a multiplicity of 0..N or 1..N. This  
 1890 means that in the cases listed above where reference reinjection is not allowed, the array or  
 1891 Collection for the reference MUST NOT change its contents. In cases where the contents of a  
 1892 reference collection MAY change, then for references that use setter injection, the setter method  
 1893 MUST be called for any change to the contents. The reinjected array or Collection MUST NOT be  
 1894 the same array or Collection object previously injected to the component.

1895

	<b>Effect on</b>		
<b>Change event</b>	Reference	Existing ServiceReference Object	Subsequent invocations of ComponentContext.getServiceReference() or getService()
Change to the target of the reference	MAY be reinjected (if other conditions* apply). If not reinjected, then it MUST continue to work as if the reference target was not changed.	MUST continue to work as if the reference target was not changed.	Result corresponds to the current configuration of the domain.
Target service	Business methods SHOULD throw	Business methods SHOULD throw	Result SHOULD be a reference to the undeployed

undeployed	InvalidServiceException.	InvalidServiceException.	or unavailable service. Business methods SHOULD throw InvalidServiceException.
Target service changed	MAY continue to work, depending on the runtime and the type of change that was made. If it doesn't work, the exception thrown will depend on the runtime and the cause of the failure.	MAY continue to work, depending on the runtime and the type of change that was made. If it doesn't work, the exception thrown will depend on the runtime and the cause of the failure.	Result SHOULD be a reference to the changed service.
<p>* Other conditions:</p> <ol style="list-style-type: none"> <li>1. The component MUST NOT be STATELESS scoped.</li> <li>2. The reference MUST use either field-based injection or setter injection. References that are injected through constructor injection MUST NOT be changed.</li> </ol> <p>** Result of invoking ComponentContext.cast() corresponds to the reference that is passed as a parameter to cast().</p>			

1896

1897

### 8.129.18 @Remotable

1898

The following Java code defines the *@Remotable* annotation:

1899

1900

```
package org.oasisopen.sca.annotation;
```

1901

```
import static java.lang.annotation.ElementType.TYPE;
```

1902

```
import static java.lang.annotation.RetentionPolicy.RUNTIME;
```

1903

```
import java.lang.annotation.Retention;
```

1904

```
import java.lang.annotation.Target;
```

1905

1906

1907

```
@Target (TYPE)
```

1908

```
@Retention (RUNTIME)
```

1909

```
public @interface Remotable {
```

1910

```
}
```

1911

1912

1913

1914

The @Remotable annotation is used to specify a Java service interface as remotable. A remotable service can be published externally as a service and must be translatable into a WSDL portType.

1915

1916

The @Remotable annotation has no attributes.

1917

The following snippet shows the Java interface for a remotable service with its @Remotable

1918

annotation.

1919

```
package services.hello;
```

1920

```
import org.oasisopen.sca.annotation.*;
```

1921

```
@Remotable
```

1922

```
public interface HelloService {
```

1923

```
String hello(String message);
```

1924

1925

1926

1927        }  
1928  
1929        The style of remotable interfaces is typically **coarse grained** and intended for **loosely coupled**  
1930        interactions. Remotable service interfaces are not allowed to make use of method **overloading**.  
1931        Complex data types exchanged via remotable service interfaces MUST be compatible with the  
1932        marshalling technology used by the service binding. For example, if the service is going to be  
1933        exposed using the standard Web Service Data binding, then the parameters MAY be JAXB [JAX-B] types  
1934        or Service Data Objects (SDOs) [SDO].  
1935        Independent of whether the remotable service is called from outside of the composite that  
1936        contains it or from another component in the same composite, the data exchange semantics are  
1937        **by-value**.  
1938        Implementations of remotable services maycan modify input data during or after an invocation  
1939        and maycan modify return data after the invocation. If a remotable service is called locally or  
1940        remotely, the SCA container is responsible for making sure that no modification of input data or  
1941        post-invocation modifications to return data are seen by the caller.  
1942        The following snippet shows a remotable Java service interface.

```
1943  
1944        package services.hello;  
1945  
1946        import org.oasisopen.sca.annotation.*;  
1947  
1948        @Remotable  
1949        public interface HelloService {  
1950  
1951            String hello(String message);  
1952        }  
1953  
1954        package services.hello;  
1955  
1956        import org.oasisopen.sca.annotation.*;  
1957  
1958        @Service(HelloService.class)  
1959        public class HelloServiceImpl implements HelloService {  
1960  
1961            public String hello(String message) {  
1962                ...  
1963            }  
1964        }
```

## 1965 9.19 @Requires

1966        The following Java code defines the **@Requires** annotation:

```
1967        package org.oasisopen.sca.annotation;  
1968  
1969        import static java.lang.annotation.ElementType.FIELD;  
1970        import static java.lang.annotation.ElementType.METHOD;  
1971        import static java.lang.annotation.ElementType.PARAMETER;  
1972        import static java.lang.annotation.ElementType.TYPE;  
1973        import static java.lang.annotation.RetentionPolicy.RUNTIME;  
1974  
1975        import java.lang.annotation.Inherited;  
1976        import java.lang.annotation.Retention;  
1977        import java.lang.annotation.Target;
```

```

1979
1980 @Inherited
1981 @Retention(RUNTIME)
1982 @Target({TYPE, METHOD, FIELD, PARAMETER})
1983 public @interface Requires {
1984     /**
1985      * Returns the attached intents.
1986      *
1987      * @return the attached intents
1988      */
1989     String[] value() default "";
1990 }

```

1992 The **@Requires** annotation supports general purpose intents specified as strings. User can also  
1993 define specific intents using @Intent annotation.

1994 See the [section "General Intent Annotations"](#) for details and samples.

## 1995 8.139.20 @Scope

1996 The following Java code defines the **@Scope** annotation:

```

1997 package org.oasisopen.sca.annotation;
1998
1999 import static java.lang.annotation.ElementType.TYPE;
2000 import static java.lang.annotation.RetentionPolicy.RUNTIME;
2001 import java.lang.annotation.Retention;
2002 import java.lang.annotation.Target;
2003
2004 @Target(TYPE)
2005 @Retention(RUNTIME)
2006 public @interface Scope {
2007     String value() default "STATELESS";
2008 }

```

2010 The @Scope annotation mayMUST only be used on a service's implementation class. It is an error  
2011 to use this annotation on an interface.

2012 The @Scope annotation has the following attribute:

- 2013 • **value** – the name of the scope.  
2014 For 'STATELESS' implementations, a different implementation instance maycan be used to  
2015 service each request. Implementation instances maycan be newly created or be drawn  
2016 from a pool of instances.  
2017 SCA defines the following scope names, but others can be defined by particular Java-  
2018 based implementation types:  
2019 STATELESS  
2020 COMPOSITE

2021 The default value is STATELESS.

2022 The following snippet shows a sample for a COMPOSITE scoped service implementation:

```

2023 package services.hello;
2024
2025 import org.oasisopen.sca.annotation.*;
2026
2027 @Service(HelloService.class)
2028 @Scope("COMPOSITE")
2029 public class HelloServiceImpl implements HelloService {
2030
2031     public String hello(String message) {

```

```
2032     ...
2033     }
2034 }
2035
```

## 2036 8.149.21 @Service

2037 The following Java code defines the **@Service** annotation:

```
2038 package org.oasisopen.sca.annotation;
2039
2040 import static java.lang.annotation.ElementType.TYPE;
2041 import static java.lang.annotation.RetentionPolicy.RUNTIME;
2042 import java.lang.annotation.Retention;
2043 import java.lang.annotation.Target;
2044
2045 @Target(TYPE)
2046 @Retention(RUNTIME)
2047 public @interface Service {
2048
2049     Class<?>[] interfaces() default {};
2050     Class<?> value() default Void.class;
2051 }
2052
```

2053 The @Service annotation is used on a component implementation class to specify the SCA services  
2054 offered by the implementation. The class need not be declared as implementing all of the  
2055 interfaces implied by the services, but all methods of the service interfaces must be present. A  
2056 class used as the implementation of a service is not required to have a @Service annotation. If a  
2057 class has no @Service annotation, then the rules determining which services are offered and what  
2058 interfaces those services have are determined by the specific implementation type.

2059 The @Service annotation has the following attributes:

- 2060 • **interfaces** – The value is an array of interface or class objects that should be exposed as  
2061 services by this component.
- 2062 • **value** – A shortcut for the case when the class provides only a single service interface.

2063 Only one of these attributes should be specified.

2064  
2065 A @Service annotation with no attributes is meaningless, it is the same as not having the  
2066 annotation there at all.

2067 The **service names** of the defined services default to the names of the interfaces or class, without  
2068 the package name.

2069 A component MUST NOT have two services with the same Java simple name. If a Java  
2070 implementation needs to realize two services with the same Java simple name then this can be  
2071 achieved through subclassing of the interface.

2072 The following snippet shows an implementation of the HelloService marked with the @Service  
2073 annotation.

```
2074 package services.hello;
2075
2076 import org.oasisopen.sca.annotation.Service;
2077
2078 @Service(HelloService.class)
2079 public class HelloServiceImpl implements HelloService {
2080
2081     public void hello(String name) {
```

```
2082         System.out.println("Hello " + name);
2083     }
2084 }
2085
```

## 2086 **9.22 Security Implementation Policy Annotations**

2087 [JSR 250 "Common Annotations for the Java Platform" defines the following annotations that can be](#)  
2088 [used for implementation security policy:](#)

2089 [javax.annotation.security.RunAs](#)  
2090 [javax.annotation.security.RolesAllowed](#)  
2091 [javax.annotation.security.PermitAll](#)  
2092 [javax.annotation.security.DenyAll](#)  
2093 [javax.annotation.security.DeclareRoles](#)

2094  
2095  
2096 [Based on JSR 250, the RunAs , DeclareRoles annotations can be specified on a class; the RolesAllowed](#)  
2097 [, PermitAll , DenyAll annotations can be specified on a class or on method\(s\).](#)

2098  
2099 [Please check JSR250 and SCA Policy spec for details on the meaning of these annotations . Please](#)  
2100 [check the section \[10.6.2\] Security Implementation Policy for the details on how these annotations are](#)  
2101 [mapped into Policy framework.](#)

2102  
2103

## 2104 910 WSDL to Java and Java to WSDL

2105 The SCA Client and Implementation Model for Java applies the WSDL to Java and Java to WSDL  
2106 mapping rules as defined by the JAX-WS specification [JAX-WS] for generating remotable Java  
2107 interfaces from WSDL portTypes and vice versa.

2108 For the purposes of the Java-to-WSDL mapping algorithm, the interface is treated as if it had a  
2109 @WebService annotation on the class, even if it doesn't, and the  
2110 @org.oasisopen.sca.annotation.OneWay annotation should be treated as a synonym for the  
2111 @javax.jws.OneWay annotation. For the WSDL-to-Java mapping, the generated @WebService  
2112 annotation implies that the interface is @Remotable.

2113 For the mapping from Java types to XML schema types, SCA permits both the JAXB 2.1 [JAX-B]  
2114 mapping and the SDO 2.1 [SDO] mapping. SCA runtimes MUST support the JAXB 2.1 mapping  
2115 and MAY support the SDO 2.1 mapping. Having a choice of binding technologies is allowed, as  
2116 noted in the first paragraph of section 5 of the JSR 181 (version 2) specification, which is  
2117 referenced by the JAX-WS specification.

2118 The JAX-WS mappings are applied with the following restrictions:

- 2119 • No support for holders

2120

2121 **Note:** This specification needs more examples and discussion of how JAX-WS's client asynchronous  
2122 model is used.

### 2123 9.110.1 JAX-WS Client Asynchronous API for a Synchronous Service

2124 The JAX-WS specification defines a mapping of a synchronous service invocation, which provides a client  
2125 application with a means of invoking that service asynchronously, so that the client can invoke a service  
2126 operation and proceed to do other work without waiting for the service operation to complete its  
2127 processing. The client application can retrieve the results of the service either through a polling  
2128 mechanism or via a callback method which is invoked when the operation completes.

2129 For SCA reference interfaces defined using interface.java, the Java interface MAY contain the additional  
2130 client-side asynchronous polling and callback methods defined by JAX-WS. For SCA service interfaces  
2131 defined using interface.java, the Java interface MUST NOT contain these methods. If these methods are  
2132 present, SCA Runtimes MUST NOT include them in the SCA reference interface as defined by the  
2133 Assembly specification. These methods are recognized as follows.

2134 For each method M in the interface, if another method P in the interface has

- 2135 a. a method name that is M's method name with the characters "Async" appended, and
- 2136 b. the same parameter signature as M, and
- 2137 c. a return type of Response<R> where R is the return type of M

2138 then P is a JAX-WS polling method that isn't part of the SCA interface contract.

2139 For each method M in the interface, if another method C in the interface has

- 2140 a. a method name that is M's method name with the characters "Async" appended, and
- 2141 b. a parameter signature that is M's parameter signature with an additional final parameter of type  
2142 AsyncHandler<R> where R is the return type of M, and
- 2143 c. a return type of Future<?>

2144 then C is a JAX-WS callback method that isn't part of the SCA interface contract.

2145 As an example, an interface may can be defined in WSDL as follows:

```
2146 <!-- WSDL extract -->  
2147 <message name="getPrice">
```

```
2148 <part name="ticker" type="xsd:string"/>
2149 </message>
2150
2151 <message name="getPriceResponse">
2152 <part name="price" type="xsd:float"/>
2153 </message>
2154
2155 <portType name="StockQuote">
2156 <operation name="getPrice">
2157 <input message="tns:getPrice"/>
2158 <output message="tns:getPriceResponse"/>
2159 </operation>
2160 </portType>
```

2161  
2162 The JAX-WS asynchronous mapping will produce the following Java interface:

```
2163 // asynchronous mapping
2164 @WebService
2165 public interface StockQuote {
2166     float getPrice(String ticker);
2167     Response<Float> getPriceAsync(String ticker);
2168     Future<?> getPriceAsync(String ticker, AsyncHandler<Float>);
2169 }
```

2170  
2171 For SCA interface definition purposes, this is treated as equivalent to the following:

```
2172 // synchronous mapping
2173 @WebService
2174 public interface StockQuote {
2175     float getPrice(String ticker);
2176 }
```

2177  
2178 SCA runtimes MUST support the use of the JAX-WS client asynchronous model. In the above  
2179 example, if the client implementation uses the asynchronous form of the interface, the two  
2180 additional getPriceAsync() methods can be used for polling and callbacks as defined by the JAX-  
2181 WS specification.

2182

## A. XML Schema: sca-interface-java.xsd

```
2183 <?xml version="1.0" encoding="UTF-8"?>
2184 <!-- (c) Copyright SCA Collaboration 2006 -->
2185 <schema xmlns="http://www.w3.org/2001/XMLSchema"
2186         targetNamespace="http://docs.oasis-open.org/ns/opencsa/sca/200712"
2187         xmlns:sca="http://docs.oasis-open.org/ns/opencsa/sca/200712"
2188         elementFormDefault="qualified">
2189
2190     <include schemaLocation="sca-core.xsd"/>
2191
2192     <element name="interface.java" type="sca:JavaInterface"
2193             substitutionGroup="sca:interface"/>
2194     <complexType name="JavaInterface">
2195         <complexContent>
2196             <extension base="sca:Interface">
2197                 <sequence>
2198                     <any namespace="##other" processContents="lax"
2199                         minOccurs="0" maxOccurs="unbounded"/>
2200                 </sequence>
2201                 <attribute name="interface" type="NCName" use="required"/>
2202                 <attribute name="callbackInterface" type="NCName"
2203                             use="optional"/>
2204                 <anyAttribute namespace="##any" processContents="lax"/>
2205             </extension>
2206         </complexContent>
2207     </complexType>
2208 </schema>
```

2209

---

## B. Conformance Items

2210 This section contains a list of conformance items for the SCA Java Common Annotations and APIs  
2211 specification.

2212

Conformance ID	Description
<a href="#">JCA30001</a>	@interface MUST be the fully qualified name of the Java interface class
<a href="#">JCA30002</a>	@callbackInterface MUST be the fully qualified name of a Java interface used for callbacks
<a href="#">JCA30003</a>	However, if the Java interface class identified by the @interface attribute does contain a Java @Callback annotation, then the Java interface class identified by the @callbackInterface attribute MUST be the same interface class.

2213

2214

## D. Non-Normative Text

2222

## E. Revision History

2223 [optional; should not be included in OASIS Standards]

2224

Revision	Date	Editor	Changes Made
1	2007-09-26	Anish Karmarkar	Applied the OASIS template + related changes to the Submission
2	2008-02-28	Anish Karmarkar	Applied resolution of issues: 4, 11, and 26
3	2008-04-17	Mike Edwards	Ed changes
4	2008-05-27	Anish Karmarkar David Booz Mark Combella	Added InvalidServiceException in Section 7 Various editorial updates
WD04	2008-08-15	Anish Karmarkar	* Applied resolution of issue 9 (it was applied before, not sure by whom, but it was applied incorrectly) * Applied resolution of issue 12, 22, 23, 29, 31, 35, 36, 37, 44, 45 * Note that issue 33 was applied, but not noted, in a previous version * Replaced the osoa.org NS with the oasis-open.org NS
WD05	2008-10-03	Anish Karmarkar	* Fixed the resolution of issue 37 but re-adding the sentence: "However, the @... annotation must be used in order to inject a property onto a non-public field. -- in the @Property and @Reference section * resolution of issue 9 was applied incorrectly. Fixed that -- removed the requirement for throwing an exception on ComponentContext.getServiceReferences() when multiplicity of references > 1 * minor ed changes
cd01-rev1	2008-12-11	Anish Karmarkar	* Fixed reference style to [RFC2119] instead of [1]. * Applied resolutions of issues 20, 21, 41, 42, 43, 47, 48, 49.
cd01-rev2	2008-12-12	Anish Karmarkar	* Applied resolutions of issues 61, 71, 72, 73, 79, 81, 82, 84, 112
cd01-rev3	2008-12-16	David Booz	* Applied resolution of issues 56, 75, 111
cd01-rev4	2009-01-18	Anish Karmarkar	* Applied resolutions of issues 28, 52, 94, 96, 99, 101
cd02	2009-01-26	Mike Edwards	Minor editorial cleanup. All changes accepted.

			All comments removed.
