ISSUE-32: Security intent which allows a client to authenticate a server

<http://www.osoa.org/jira/browse/POLICY-32>

Latest email:

Dave B: Explains the origins of the issues

Ashok: Debate about what the intent means in the current spec - does it imply that the client may authenticate the server.

Mike E: I don't read the current spec as being normative about the client authenticating the server

Discussion about the idea that the Policy can be more restrictive than the intents that are specified

Rich - thinks that authentication applied to a reference has the simple interpretation that the client needs to authenticate the server

Dave B: The whole point of configuring the reference is to mark the requirements that the client has on any service that it may use - ie if it is marked as "authenticate" then the client is saying that any service that it is wired to must perform authentication of the client, otherwise the client is not prepared to use that service

Rich: It seems obvious to me that an authentication intent on a reference implies that the client is going to authenticate the server, while authentication on the service means the service authenticates the client

Mike E: It makes it explicit if we have 2 intents - one for each kind of authentication - and you can have a profile intent to cover "mutual authentication"

Ashok: what happens with the qualified form of these intents - for transport & message? - we think that it does work. So we propose that the authentication intent is split into two - clientAuthentication and serverAuthentication, each of which can be qualified with message or transport and have a 3rd intent "mutualAuthentication" which is the combination of the two

Action 20081215-01: (Ashok & Rich) To write up a detailed proposal for Issue 32
