

1 This is a *DRAFT CHARTER* for discussion and review, William Cox,
2 [wtcox@CoxSoftwareArchitects.com](mailto:wtcoc@CoxSoftwareArchitects.com), editor.

3 While this proposal is not confidential, the names and affiliations of
4 sponsors will be until nearly time for submission to the formal OASIS
5 review process.

6 If you would like to support this proposal, send email to the editor.

7 Comments to the mailing list

8 smartgrid-interest@lists.oasis-open.org.

9 To subscribe to the smartgrid-interest list, either send a message to the
10 list address, smargrid-interest@lists.oasis-open.org with “subscribe” in
11 the subject line, or go to <http://www.oasis-open.org/mlmanage/> , enter
12 your email address, and click Manage Subscriptions. Smartgrid-interest
13 is half way down the right hand column on the next page.

14 In either case, you should receive a message from the subscription
15 management software.

16 The mailing list is open to anyone, OASIS Member or not.

17 If you would like to support this proposal, please send email to the
18 editor.

21

22 ***OASIS Energy Market Information Exchange***
23 ***Technical Committee Charter***
24 ***Draft of March 30, 2009***

25 **1) The Charter of the TC, which includes only the following**
26 **items:**

27 ***(1)(a) The name of the TC***

28 OASIS Energy Market Information Exchange TC

29 ***(1)(b) A statement of purpose, including a definition of the problem to***
30 ***be solved.***

31 Energy markets have been characterized by poor coordination of supply and demand.
32 This failing has exacerbated the problems caused by rising energy demand. In
33 particular, poor communications concerning times of peak use cause economic loss
34 to energy suppliers and consumers. There are today a limited number of high demand
35 periods (roughly ten days a year, and only a portion of those days) when the failure
36 to manage peak demand causes immense costs to the provider of energy; and, if the
37 demand cannot be met, expensive degradations of service to the consumer of energy.
38 As the proportion of alternative energies on the grid rises, and more energy comes
39 from unreliable sources, the frequency and scale of these problems will increase.

40 Energy consumers can use a variety of technologies and strategies to shift energy use
41 to times of lower demand and also to reduce use during peak periods. This shifting
42 and reduction can reduce the need for new power plants, and transmission and
43 distribution systems. These changes will reduce the overall costs of energy through
44 greater economic efficiency. This process is called various names, including Demand
45 Response (DR), demand shaping, and load shaping.

46 Distributed energy generation now challenges the traditional hierarchical relationship
47 of supplier and consumer. Alternative and renewable energy sources may be placed
48 closer to the end nodes of the grid. Wind and solar generation, as well as industrial
49 co-generation, allow end nodes to sometimes be energy suppliers. Energy storage,
50 particularly in plug-in hybrid vehicles, means that the same device may be
51 sometimes a supplier, sometime a consumer. As these sources are all intermittent,
52 they increase the challenge of coordinating supply and demand to maintain the
53 reliability of the electric grid.

54
55 Better communication of energy prices addresses growing needs for lower-carbon,
56 lower-energy buildings, net zero-energy systems, and supply-demand integration that
57 take advantage of dynamic pricing. Local generation and local storage require that
58 the consumer (in today's situation) make investments in technology and
59 infrastructure including electric charging and thermal storage systems. Buildings and
60 businesses and the power grid will benefit from automated and timely
61 communication of energy pricing, capacity information, and other grid information.

62
63 A consistent model for market information exchange can be applied, perhaps with
64 elaboration or subsetting, to allow essentially the same information exchange for
65 homes, individual appliances, small businesses, commercial buildings, office parks,

66 neighborhood grids, and industrial facilities, simplifying communication flow across
67 the broad range of energy providers, distributors, and consumers, and reducing costs
68 for implementation.

69
70 These communications will involve energy consumers, producers, transmission and
71 distribution systems, and must enable aggregation for both consumption and
72 curtailment resources. Market makers, such as Independent System Operators
73 (ISOs), Regional Transmission Operators (RTOs), utilities, and other evolving
74 mechanisms need to deliver actionable information in consistent formats as the Smart
75 Grid evolves. With information in consistent formats, building and facility agents can
76 make decisions on energy sale, purchase, and use that fit the goals and requirements
77 of their home, business, or industrial facility.

78
79 The new symmetry of energy transactions demands symmetry of interface. A net
80 consumer of energy may be a producer when the sun is shining, the wind is blowing,
81 or a facility is producing co-generated energy. Each information exchange must
82 support symmetry as well, with energy and economic transactions flowing each way.

83
84 In addition to architectural symmetry, this work should create composed and
85 composable solutions that leverage existing technologies (such as OASIS fine-
86 grained web services security standards) rather than reinventing.

87
88 To gain the economic and societal benefits promised by Smart Buildings/Facilities
89 and Enterprises as aspects of Smart Grids, dynamic pricing, reliability, and
90 emergency signals must be communicated through interoperability mechanisms that
91 meet business needs, scale, use a variety of communication technologies, maintain
92 security and privacy, and are reliable.

93
94 As technology evolves, we must try to define interoperability in a manner that will
95 work with anticipated changes as well as those we cannot predict. Automated and
96 timely communication of price, bid, and characteristics of energy are important to
97 growing and increasing the efficiency of energy markets.

98
99 The Technical Committee will focus on means of exchanging market information
100 consistent with the OASIS BLUE approach (see [http://www.oasis-
102 open.org/resources/white-papers/blue/](http://www.oasis-
101 open.org/resources/white-papers/blue/)), including consistency, transparency, and
103 security.

104 The data exchanged is critical information for dynamic pricing and determining the
105 characteristics of what is purchased and sold.

106 ***(1)(c) The scope of the work of the TC.***

107 This TC will leverage existing work wherever feasible, and will produce
108 specifications for interoperation consistent with architectural principles including
109 symmetry, composability, service orientation, and aggregation.

110
111 The TC will develop a data model and XML vocabulary to enable collaborative and
112 transactive use of energy. Web services definitions, service definitions consistent
113 with the OASIS SOA Reference Model, and XML vocabularies will be developed as
114 needed for interoperable and standard exchange of:

- 115 • Dynamic price information
- 116 • Bid information
- 117 • Time for use or availability
- 118 • Units and quantity to be traded
- 119 • Characteristics of what is to be traded
- 120 • Deal/Bid/Acceptance confirmations

121
122 This work will be done to facilitate interaction with energy markets, including but
123 not limited to:

- 124 • Take advantage of lower energy costs by deferring or accelerating usage
- 125 • Enable trading of curtailment and generation
- 126 • Enable futures markets and specific contracted time of use and provision
- 127 • Enable market decisions based on characteristics of energy traded, including
128 but not limited to source (e.g. renewable) and carbon characteristics
- 129 • Enable auditing of transactions and characteristics of that which is traded
- 130 • Support symmetry of interaction between providers and consumers of energy
- 131 • Provide for aggregation of provision, curtailment, and use

132
133 The definition of a price and of other market information exchanged depends in part
134 on the market context in which it exists. It is not in scope for this TC to define
135 specifications for markets or for interoperation, but the TC will coordinate with
136 others to ensure that commonly used market and communication models are
137 supported.

138

139 The data models and XML vocabularies defined by this TC will address issues in
140 energy markets and the Smart Grid, but may be defined so as to support requirements
141 for other markets.

142
143 This work is intended to be usable by the OASIS Energy Interoperation TC and other
144 Smart Grid standardization.

145
146 Models and requirements for cybersecurity and privacy will be addressed in the TC's
147 work.

148
149 Specific work with which the TC intends to coordinate is listed in Section (2)(a).

150 ***(1)(d) A list of deliverables, with projected completion dates.***

151 Projected times are from inception, the date of the initial TC meeting.

152
153 Insofar as possible the TC will coordinate its schedules with the OASIS Energy
154 Interoperation TC, UCAIug and other initiatives including those supported by NIST
155 and related regulatory agencies.

156
157 TBD

158 ***(1)(e) Specification of the IPR Mode under which the TC will operate.***

159 The TC shall operate under RF on Limited Terms.

160 ***(1)(f) The anticipated audience or users of the work.***

161 Anticipated users of this work include:

- 162 • Implementers of facility agents, embedded controllers, decision management
163 systems, and gateways
- 164 • Market makers such as Independent System Operators and Regional
165 Transmission Operators
- 166 • Participants in energy markets at all levels (e.g. retail, wholesale, curtailment,
167 and forward/futures energy trading)
- 168 • Aggregators of energy provision, curtailment, and use
- 169 • Generators
- 170 • Energy storage facilities
- 171 • Consumers of energy, for acquiring energy in a cost-effective manner
172 consistent with their business and/or personal activities

173 **(1)(g) *The language in which the TC shall conduct business.***

174 The TC will use English as the language for conducting its operations.

175

175 **(2) Non-normative information regarding the startup of the TC:**

176 ***(2)(a) Identification of similar or applicable work that is being done in***
177 ***other OASIS TCs or by other organizations, why there is a need for***
178 ***another effort in this area and how this proposed TC will be different,***
179 ***and what level of liaison will be pursued with these other organizations.***

180 There are many means for market information exchange of bids and prices, including
181 XML vocabularies. The characteristics of energy, such as source (geothermal,
182 hydroelectric, natural gas generation, hard coal, soft coal generators with stack
183 scrubbers, carbon characteristics) are of present and future interest. Today's energy
184 markets command a premium for renewable energy, but no means of consistently
185 tagging energy with its source or characteristics.

186
187 The intention of this work is to define data models and vocabularies that express
188 critical needs for energy market information exchange, and may permit extensibility
189 to similar markets in the future.

190
191 We believe that close coordination and balancing among the full range of
192 stakeholders is essential to ensure that a single, technology independent requirements
193 specification and abstract information model can be developed that can be
194 implemented by the OASIS TC and any other entities that may develop non-XML
195 profiles, thus assuring interoperation at the model level in the future.

196
197 The utilities, Independent System Operators (ISOs), Regional Transmission
198 Operators (RTOs), energy market makers, and wholesale energy market participants
199 have defined models and XML vocabularies that could support and contribute to this
200 TC's work. We welcome them as stakeholders and contributors.

201
202 We anticipate input from technology, policy and business stakeholders and
203 organizations, including but not limited to NIST Domain Expert Working Groups
204 (NIST DEWG) and Task Groups (<http://www.nist.gov/smartgrid/>), The Federal
205 Energy Regulatory Commission (FERC <http://www.ferc.gov>), the National
206 Association of Regulatory Utility Commissioners (NARUC <http://naruc.org/>) and the
207 Electric Power Research Institute (EPRI <http://www.epri.com>).

208
209 The development of open, transactive energy is a goal of the GridWise Architecture
210 Council (<http://www.gridwiseac.org/>). We expect to engage the members throughout

211 the lifecycle of the TC, as well as with emerging Smart Grid Architecture efforts
212 from NIST.
213
214 The definition of a market is a required context for understanding prices, pricing, and
215 bids. Market definition is outside the scope of this TC; we expect to interact with
216 work developing out of the 2009 GridEcon conference
217 (<http://www.gridecon.com/2009/>), NIST, and the evolving Smart Grid Framework
218 Roadmap.
219
220 European markets have an additional area of interface, between Transmission and
221 Distribution (in American terminology), as these are typically under separate
222 ownership. As time allows, or in a future update, the TC may address those needs as
223 well.
224
225 Work on defining business attributes of a service, being developed by the OASIS
226 Service Oriented Architecture End-to-End Resource Planning TC (SOA-EERP TC),
227 may apply to define attributes of energy.
228
229 The (proposed, in formation) OASIS WS-Calendaring Technical Committee will be
230 creating an interoperable XML vocabulary and model for time that is applicable to
231 energy pricing and automated building management. We expect to coordinate with
232 that TC when it is formed.
233
234 Composability with the WS-Transaction family of OASIS Standards may be
235 beneficial for consistent distributed outcomes, particularly across enterprises with
236 diverse ownership.
237
238 Service definitions and the approach of the TC should be consistent with the OASIS
239 Service Oriented Architecture Reference Model ([http://www.oasis-
240 open.org/specs/#soa-rmv1.0](http://www.oasis-open.org/specs/#soa-rmv1.0)) and industry practice in that area.
241
242 Other work TBD.

243 ***(2)(b) The date, time, and location of the first meeting, whether it will be***
244 ***held in person or by phone, and who will sponsor this first meeting. The***
245 ***first meeting of a TC shall occur no less than 30 days after the***
246 ***announcement of its formation in the case of a telephone or other***
247 ***electronic meeting, and no less than 45 days after the announcement of***
248 ***its formation in the case of a face-to-face meeting.***

249
250 TBD

251 ***(2)(c) The projected on-going meeting schedule for the year following***
252 ***the formation of the TC, or until the projected date of the final***
253 ***deliverable, whichever comes first, and who will be expected to***
254 ***sponsor these meetings.***

255 The TC will conduct its business via weekly teleconference calls. The time of the call
256 will be determined during the first meeting of the TC. The TC will conduct face-to-
257 face meetings as needed and determined by the TC. The TC participants will sponsor
258 teleconference facilities and face-to-face meetings.

259
260 Under OASIS procedures, a Chair or co-Chairs will be elected at the first meeting.

261
262 Time zone difference of participants may require flexibility in meeting times,
263 quorum, and subcommittees (if any).

264 ***(2)(d) The names, electronic mail addresses, and membership***
265 ***affiliations of at least Minimum Membership who support this proposal***
266 ***and are committed to the Charter and projected meeting schedule.***

267
268 ***Note: need a minimum of 5, of which at least two of which must work for OASIS***
269 ***Organizational Members.***

270
271 PENDING. Contact [wtcox@CoxSoftwareArchitects.com](mailto:wtc@CoxSoftwareArchitects.com) if you are interested in
272 supporting this work.

273 ***(2)(e) The name of the Convener who must be an Eligible Person.***

274
275 TBD

276 ***(2)(f) The name of the Member Section with which the TC intends to***
277 ***affiliate***

278 The Energy Market Information Exchange TC intends to affiliate with the OASIS
279 BLUE Member Section.

280 ***(2)(g) Optionally, a list of contributions of existing technical work that***
281 ***the proposers anticipate will be made to this TC.***

282
283 TBD
284

285 ***(2)(h) Optionally, a draft Frequently Asked Questions (FAQ) document***
286 ***regarding the planned scope of the TC, for posting on the TC's website.***

287
288 TBD

289 ***(2)(i) Optionally, a proposed working title and acronym for the***
290 ***specification(s) to be developed by the TC.***
