16 Abstract:

- This specification (WS-ReliableMessaging) describes a protocol that allows messages to be transferred reliably between nodes implementing this protocol in the presence of software component, system, or network failures. The protocol is described in this specification in a transport-independent manner allowing it to be implemented using different network technologies. To support interoperable Web services, a SOAP binding is defined within this specification.
- The protocol defined in this specification depends upon other Web services specifications for the identification of service endpoint addresses and policies. How these are identified and retrieved are detailed within those specifications and are out of scope for this document.
- By using the XML [XML], SOAP [SOAP 1.1], [SOAP 1.2] and WSDL [WSDL 1.1] extensibility model,
- SOAP-based and WSDL-based specifications are designed to be composed with each other to define a rich Web services environment. As such, WS-ReliableMessaging by itself does not define all the features required for a complete messaging solution. WS-ReliableMessaging is a building block that is used in conjunction with other specifications and application-specific protocols to accommodate a wide variety of
- requirements and scenarios related to the operation of distributed Web services.

31 Status:

- This document was last revised or approved by the WS-RX on the above date. The level of approval is also listed above. Check the current location noted above for possible later revisions of this document. This document is updated periodically on no particular schedule. Technical Committee members should
- 35 send comments on this specification to the Technical Committee's email list. Others should send
- 36 comments to the Technical Committee by using the "Send A Comment" button on the Technical
- 37 Committee's web page at http://www.oasis-open.org/committees/ws-rx. For information on whether any
- patents have been disclosed that may be essential to implementing this specification, and any offers of
- ³⁹ patent licensing terms, please refer to the Intellectual Property Rights section of the Technical
- 40 Committee web page (http://www.oasis-open.org/committees/ws-rx/ipr.php. The non-normative errata
- 41 page for this specification is located at http://www.oasis-open.org/committees/ws-rx.

109 **1** Introduction

110 It is often a requirement for two Web services that wish to communicate to do so reliably in the presence

111 of software component, system, or network failures. The primary goal of this specification is to create a

112 modular mechanism for reliable transfer of messages. It defines a messaging protocol to identify, track,

and manage the reliable transfer of messages between a source and a destination. It also defines a

114 SOAP binding that is required for interoperability. Additional bindings can be defined.

115 This mechanism is extensible allowing additional functionality, such as security, to be tightly integrated.

116 This specification integrates with and complements the WS-Security [WS-Security], WS-Policy [WS-

117 Policy], and other Web services specifications. Combined, these allow for a broad range of reliable,

118 secure messaging options.

119 1.1 Notational Conventions

120 The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD

121 NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described 122 in RFC 2119 [KEYWORDS].

123 This specification uses the following syntax to define normative outlines for messages:

- The syntax appears as an XML instance, but values in italics indicate data types instead of values.
- Characters are appended to elements and attributes to indicate cardinality:
- 126 o "?" (0 or 1)
- 127 o "*" (0 or more)
- 128 o "+" (1 or more)
- The character "|" is used to indicate a choice between alternatives.
- The characters "[" and "]" are used to indicate that contained items are to be treated as a group with respect to cardinality or choice.
- An ellipsis (i.e. "...") indicates a point of extensibility that allows other child or attribute content
 specified in this document. Additional children elements and/or attributes MAY be added at the
 indicated extension points but they MUST NOT contradict the semantics of the parent and/or
 owner, respectively. If an extension is not recognized it SHOULD be ignored.
- XML namespace prefixes (See Section 1.2) are used to indicate the namespace of the element
 being defined.

Elements and Attributes defined by this specification are referred to in the text of this document using
 XPath 1.0 [XPATH 1.0] expressions. Extensibility points are referred to using an extended version of this
 syntax:

An element extensibility point is referred to using {any} in place of the element name. This
 indicates that any element name can be used, from any namespace other than the wsrm:
 namespace.

An attribute extensibility point is referred to using @{any} in place of the attribute name. This
 indicates that any attribute name can be used, from any namespace other than the wsrm:
 namespace.

147 **1.2 Namespace**

148 The XML namespace [XML-ns] URI that MUST be used by implementations of this specification is:

149 http://docs.oasis-open.org/ws-rx/wsrm/200608

150 Dereferencing the above URI will produce the Resource Directory Description Language [RDDL 2.0]

151 document that describes this namespace.

152 Table 1 lists the XML namespaces that are used in this specification. The choice of any namespace prefix

- 153 is arbitrary and not semantically significant.
- 154 Table 1

Prefix	Namespace	
S	(Either SOAP 1.1 or 1.2)	
S11	http://schemas.xmlsoap.org/soap/envelope/	
S12	http://www.w3.org/2003/05/soap-envelope	
wsrm	http://docs.oasis-open.org/ws-rx/wsrm/200608	
wsa	http://www.w3.org/2005/08/addressing	
wsaw	http://www.w3.org/2006/05/addressing/wsdl	
wsse	http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-secext-1.0.xsc	
xs	http://www.w3.org/2001/XMLSchema	

155 The normative schema for WS-ReliableMessaging can be found linked from the namespace document

156 that is located at the namespace URI specified above.

157 All sections explicitly noted as examples are informational and are not to be considered normative.

158 **1.3 Conformance**

159 An implementation is not conformant with this specification if it fails to satisfy one or more of the MUST or

160 REQUIRED level requirements defined herein. A SOAP Node MUST NOT use the XML namespace

- identifier for this specification (listed in Section 1.2) within SOAP Envelopes unless it is conformant withthis specification.
- 163 Normative text within this specification takes precedence over normative outlines, which in turn take
- 164 precedence over the XML Schema [XML Schema Part 1, Part 2] descriptions.

165 2 Reliable Messaging Model

166 Many errors can interrupt a conversation. Messages can be lost, duplicated or reordered. Further the host 167 systems can experience failures and lose volatile state.

168 The WS-ReliableMessaging specification defines an interoperable protocol that enables a Reliable

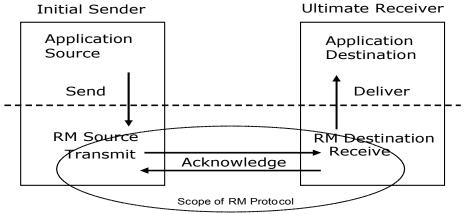

Messaging (RM) Source to accurately determine the disposition of each message it Transmits as perceived by the RM Destination, so as to allow it to resolve any in-doubt status regarding receipt of the

message Transmitted. The protocol also enables an RM Destination to efficiently determine which of

- those messages it Receives have been previously Received, enabling it to filter out duplicate message
- transmissions caused by the retransmission, by the RM Source, of an unacknowledged message. It also
- 174 enables an RM Destination to Deliver the messages it Receives to the Application Destination in the order

in which they were sent by an Application Source, in the event that they are Received out of order. Note

- that this specification places no restriction on the scope of the RM Source or RM Destination entities. For
- 177 example, either can span multiple WSDL Ports or Endpoints.
- 178 The protocol enables the implementation of a broad range of reliability features which include ordered
- 179 Delivery, duplicate elimination, and guaranteed receipt. The protocol can also be implemented with a
- 180 range of robustness characteristics ranging from in-memory persistence that is scoped to a single process
- 181 lifetime, to replicated durable storage that is recoverable in all but the most extreme circumstances. It is
- 182 expected that the Endpoints will implement as many or as few of these reliability characteristics as
- 183 necessary for the correct operation of the application using the protocol. Regardless of which of the
- 184 reliability features is enabled, the wire protocol does not change.
- 185 Figure 1 below illustrates the entities and events in a simple reliable exchange of messages. First, the
- 186 Application Source Sends a message for reliable transfer. The Reliable Messaging Source accepts the
- 187 message and Transmits it one or more times. After accepting the message, the RM Destination
- 188 Acknowledges it. Finally, the RM Destination Delivers the message to the Application Destination. The
- 189 exact roles the entities play and the complete meaning of the events will be defined throughout this
- 190 specification.

191 Figure 1: Reliable Messaging Model

192 2.1 Glossary

193 The following definitions are used throughout this specification:

Accept: The act of qualifying a message by the RM Destination such that it becomes eligible for Delivery and acknowledgement.

- 196 Acknowledgement: The communication from the RM Destination to the RM Source indicating the
- 197 successful receipt of a message.
- 198 Acknowledgement Message: A message containing a SequenceAcknowledgement header block.
- 199 Acknowledgement Messages may or may not contain a SOAP body.
- 200 Acknowledgement Request: A message containing an AckRequested header. Acknowledgement
- 201 Requests may or may not contain a SOAP body.
- 202 Application Destination: The Endpoint to which a message is Delivered.
- 203 Application Source: The Endpoint that Sends a message.
- 204 Back-channel: When the underlying transport provides a mechanism to return a transport-protocol
- specific response, capable of carrying a SOAP message, without initiating a new connection, thisspecification refers to this mechanism as a back-channel.
- 207 **Deliver:** The act of transferring a message from the RM Destination to the Application Destination.
- 208 Endpoint: As defined in the WS-Addressing specification [WS-Addressing]; a Web service Endpoint is a
- 209 (referenceable) entity, processor, or resource to which Web service messages can be addressed.
- 210 Endpoint references (EPRs) convey the information needed to address a Web service Endpoint.
- 211 Receive: The act of reading a message from a network connection and accepting it.
- 212 **RM Destination:** The Endpoint that Receives messages Transmitted reliably from an RM Source.
- 213 **RM Protocol Header Block: One of** Sequence, SequenceAcknowledgement, **or** AckRequested.
- 214 **RM Source:** The Endpoint that Transmits messages reliably to an RM Destination.
- **Send:** The act of transferring a message from the Application Source to the RM Source for reliable transfer.
- 217 Sequence Lifecycle Message: A message that contains one of: CreateSequence,
- 218 CreateSequenceResponse, CloseSequence, CloseSequenceResponse, TerminateSequence,
- 219 TerminateSequenceResponse as the child element of the SOAP body element.
- 220 Sequence Traffic Message: A message containing a Sequence header block.
- 221 **Transmit:** The act of writing a message to a network connection.

222 2.2 Protocol Preconditions

- The correct operation of the protocol requires that a number of preconditions MUST be established prior to the processing of the initial sequenced message:
- For any single message exchange the RM Source MUST have an endpoint reference that uniquely identifies the RM Destination Endpoint.
- The RM Source MUST have successfully created a Sequence with the RM Destination.
- The RM Source MUST be capable of formulating messages that adhere to the RM Destination's policies.
- If a secure exchange of messages is REQUIRED, then the RM Source and RM Destination MUST
 have a security context.

232 2.3 Protocol Invariants

During the lifetime of a Sequence, two invariants are REQUIRED for correctness: 233

- The RM Source MUST assign each message within a Sequence a message number (defined 234 below) beginning at 1 and increasing by exactly 1 for each subsequent message. These numbers 235 MUST be assigned in the same order in which messages are sent by the Application Source. 236
- 237 Within every Acknowledgement Message it issues, the RM Destination MUST include one or more AcknowledgementRange child elements that contain, in their collective ranges, the message 238 239 number of every message accepted by the RM Destination. The RM Destination MUST exclude, in the AcknowledgementRange elements, the message numbers of any messages it has not 240 241 accepted. If no messages have been received the RM Destination MUST return None instead of an AcknowledgementRange(s). The RM Destination MAY transmit a Nack for a specific message 242
- 243 or messages in stead of an AcknowledgementRange(s).

2.4 Example Message Exchange 244

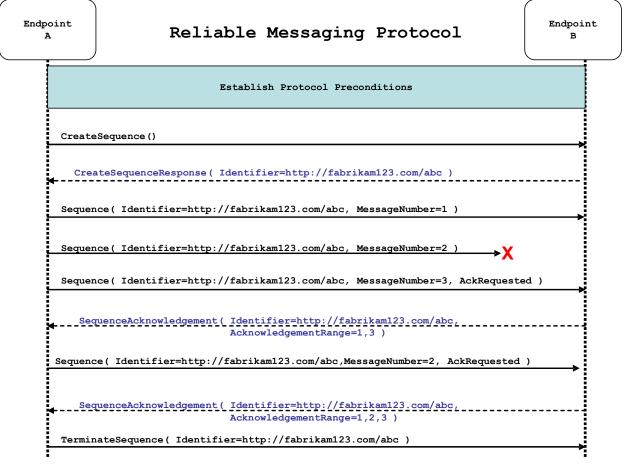

Figure 2: The WS-ReliableMessaging Protocol

1. The protocol preconditions are established. These include policy exchange, endpoint resolution, 246 and establishing trust. 247

- 248 2. The RM Source requests creation of a new Sequence.
- 249 3. The RM Destination creates a new Sequence and returns its unique identifier.
- 4. The RM Source begins Transmitting messages in the Sequence beginning with MessageNumber 1.
 In the figure above, the RM Source sends 3 messages in the Sequence.
- 5. The 2nd message in the Sequence is lost in transit.
- 253 6. The 3rd message is the last in this Sequence and the RM Source includes an AckRequested
 254 header to ensure that it gets a timely SequenceAcknowledgement for the Sequence.
- 7. The RM Destination acknowledges receipt of message numbers 1 and 3 as a result of receiving the
 RM Source's AckRequested header.
- 8. The RM Source retransmits the unacknowledged message with MessageNumber 2. This is a new message from the perspective of the underlying transport, but it has the same Sequence Identifier and MessageNumber so the RM Destination can recognize it as a duplicate of the earlier message, in case the original and retransmitted messages are both Received. The RM Source includes an AckRequested header in the retransmitted message so the RM Destination will expedite an acknowledgement.
- 263
 9. The RM Destination Receives the second transmission of the message with MessageNumber 2
 264 and acknowledges receipt of message numbers 1, 2, and 3.
- 10. The RM Source Receives this Acknowledgement and sends a TerminateSequence message to the
 RM Destination indicating that the Sequence is completed and reclaims any resources associated
 with the Sequence.
- 11. The RM Destination Receives the TerminateSequence message indicating that the RM Source will
 not be sending any more messages. The RM Destination sends a TerminateSequenceResponse
 message to the RM Source and reclaims any resources associated with the Sequence.
- 271 The RM Source will expect to Receive Acknowledgements from the RM Destination during the course of a
- 272 message exchange at occasions described in Section 3 below. Should an Acknowledgement not be
- 273 Received in a timely fashion, the RM Source MUST re-transmit the message since either the message or
- the associated Acknowledgement might have been lost. Since the nature and dynamic characteristics of
- the underlying transport and potential intermediaries are unknown in the general case, the timing of re-
- transmissions cannot be specified. Additionally, over-aggressive re-transmissions have been
- 277 demonstrated to cause transport or intermediary flooding which are counterproductive to the intention of
- 278 providing a reliable exchange of messages. Consequently, implementers are encouraged to utilize
- 279 adaptive mechanisms that dynamically adjust re-transmission time and the back-off intervals that are
- appropriate to the nature of the transports and intermediaries envisioned. For the case of TCP/IP
- transports, a mechanism similar to that described as RTTM in RFC 1323 [RTTM] SHOULD be
- 282 considered.
- Now that the basic model has been outlined, the details of the elements used in this protocol are now
- 284 provided in Section 3.

285 **3 RM Protocol Elements**

The following sub-sections define the various RM protocol elements, and prescribe their usage by a conformant implementations.

288 3.1 Considerations on the Use of Extensibility Points

289 The following protocol elements define extensibility points at various places. Implementations MAY add

290 child elements and/or attributes at the indicated extension points but MUST NOT contradict the semantics

291 of the parent and/or owner, respectively. If a receiver does not recognize an extension, the receiver

292 SHOULD ignore the extension.

293 3.2 Considerations on the Use of "Piggy-Backing"

Some RM Protocol Header Blocks may be added to messages that are targeted to the same Endpoint to which those headers are to be sent (a concept often referred to as "piggy-backing"), thus saving the overhead of an additional message exchange. Reference parameters MUST be considered when determining whether two EPRs are targeted to the same Endpoint. The determination of if and when a Header Block will be piggy-backed onto another message is made by the entity (RMS or RMD) that is sending the header. See the sections that define each RM header block to know which ones may be considered for piggy-backing.

301 3.3 Composition with WS-Addressing

When the RM protocol, defined in this specification, is composed with the WS-Addressing specification, the following rules prescribe the constraints on the value of the wsa:Action header:

 When an Endpoint generates a message that carries an RM protocol element, that is defined in section 3 below, in the body of a SOAP envelope that Endpoint MUST include in that envelope a wsa:Action SOAP header block whose value is an IRI that is a concatenation of the WS-RM namespace URI, followed by a "/", followed by the value of the local name of the child element of the SOAP body. For example, for a Sequence creation request message as described in section 3.4 below, the value of the wsa:Action IRI would be:

310		http://docs.oasis-open.org/ws-rx/wsrm/200608/CreateSequence				
311 2. When an Endpoint generates an Acknowledgement Message th		When an Endpoint generates an Acknowledgement Message that has no element content in the				
312		SOAP body, then the value of the wsa:Action IRI MUST be:				
313 http://docs.oasis-open.org/ws-rx/wsrm/200608/SequenceAcknowledgement						
314 3. When an Endpoint generates an Acknowledgement Request that has no elem		When an Endpoint generates an Acknowledgement Request that has no element content in the				
315 SOAP body, then the value of the wsa:Action IRI MUST be:		SOAP body, then the value of the wsa:Action IRI MUST be:				
316		http://docs.oasis-open.org/ws-rx/wsrm/200608/AckRequested				
317	4. When an Endpoint generates an RM fault as defined in section 4 below, the value of the					
318 wsa:Action IRI MUST be as defined in section 4 below.						

319 3.4 Sequence Creation

The RM Source MUST request creation of an outbound Sequence by sending a CreateSequence element in the body of a message to the RM Destination which in turn responds either with a message

322 containing CreateSequenceResponse or a CreateSequenceRefused fault. The RM Source MAY

include an offer to create an inbound Sequence within the CreateSequence message. This offer is either accepted or rejected by the RM Destination in the CreateSequenceResponse message.

The SOAP version used for the CreateSequence message SHOULD be used for all subsequent messages in or for that Sequence, sent by either the RM Source or the RM Destination.

327 The following exemplar defines the CreateSequence syntax:

328	<wsrm:createsequence></wsrm:createsequence>
329	<wsrm:acksto> wsa:EndpointReferenceType </wsrm:acksto>
330	<pre><wsrm:expires> xs:duration </wsrm:expires> ?</pre>
331	<wsrm:offer></wsrm:offer>
332	<wsrm:identifier> xs:anyURI </wsrm:identifier>
333	<pre><wsrm:endpoint> wsa:EndpointReferenceType </wsrm:endpoint></pre>
334	<pre><wsrm:expires> xs:duration </wsrm:expires> ?</pre>
335	<wsrm:incompletesequencebehavior></wsrm:incompletesequencebehavior>
336	wsrm:IncompleteSequenceBehaviorType
337	<pre> ?</pre>
338	
339	?
340	
341	

- 342 The following describes the content model of the CreateSequence element.
- 343 /wsrm:CreateSequence
- 344 This element requests creation of a new Sequence between the RM Source that sends it, and the RM
- 345 Destination to which it is sent. The RM Source MUST NOT send this element as a header block. The RM
- 346 Destination MUST respond either with a CreateSequenceResponse response message or a
- 347 CreateSequenceRefused fault.
- 348 /wsrm:CreateSequence/wsrm:AcksTo
- 349 The RM Source MUST include this element in any CreateSequence message it sends. This element is of
- 350 type wsa:EndpointReferenceType (as specified by WS-Addressing). It specifies the endpoint
- 351 reference to which messages containing SequenceAcknowledgement header blocks and faults related
- to the created Sequence are to be sent, unless otherwise noted in this specification (for example, see
- 353 Section 3.5).
- 354 Implementations MUST NOT use an endpoint reference in the AcksTo element that would prevent the
- 355 sending of Sequence Acknowledgements back to the RM Source. For example, using the WS-Addressing
- "http://www.w3.org/2005/08/addressing/none" IRI would make it impossible for the RM Destination to ever
- 357 send Sequence Acknowledgements.
- 358 /wsrm:CreateSequence/wsrm:Expires
- 359 This element, if present, of type xs:duration specifies the RM Source's requested duration for the
- 360 Sequence. The RM Destination MAY either accept the requested duration or assign a lesser value of its
- 361 choosing. A value of "PT0S" indicates that the Sequence will never expire. Absence of the element
- 362 indicates an implied value of "PT0S".
- 363 /wsrm:CreateSequence/wsrm:Expires/@{any}
- This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.
- 366 /wsrm:CreateSequence/wsrm:Offer

This element, if present, enables an RM Source to offer a corresponding Sequence for the reliable exchange of messages Transmitted from RM Destination to RM Source.

369 /wsrm:CreateSequence/wsrm:Offer/wsrm:Identifier

The RM Source MUST set the value of this element to an absolute URI (conformant with RFC3986 [URI]) that uniquely identifies the offered Sequence.

372 /wsrm:CreateSequence/wsrm:Offer/wsrm:Identifier/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

375 /wsrm:CreateSequence/wsrm:Offer/wsrm:Endpoint

376 An RM Source MUST include this element, of type wsa: EndpointReferenceType (as specified by

377 WS-Addressing). This element specifies the endpoint reference to which Sequence Lifecycle Messages,

378 Sequence Traffic Messages, Acknowledgement Requests, and fault messages related to the offered

379 Sequence are to be sent.

Implementations MUST NOT use an endpoint reference in the Endpoint element that would prevent the

381 sending of Sequence Lifecycle Message, Sequence Traffic Message, etc. For example, using the WS-

Addressing "http://www.w3.org/2005/08/addressing/none" IRI would make it impossible for the RM

383 Destination to ever send Sequence Lifecycle Messages (e.g. TerminateSequence) to the RM Source

for the Offered Sequence. Implementations MAY use the WS-RM anonymous URI template and doing so

- implies that messages will be retrieved using a mechanism such as the MakeConnection message (see section 3.10).
- 387 /wsrm:CreateSequence/wsrm:Offer/wsrm:Expires

388 This element, if present, of type xs:duration specifies the duration for the offered Sequence. A value of

- ³⁸⁹ "PT0S" indicates that the offered Sequence will never expire. Absence of the element indicates an implied ³⁹⁰ value of "PT0S".
- 391 /wsrm:CreateSequence/wsrm:Offer/wsrm:Expires/@{any}
- This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.
- 394 /wsrm:CreateSequence/wsrm:Offer/wsrm:IncompleteSequenceBehavior

395 This element, if present, specifies the behavior that the destination will exhibit upon the closure or

termination of an incomplete Sequence. For the purposes of defining the values used, the term "discard"

³⁹⁷ refers to behavior equivalent to the Application Destination never processing a particular message.

398 A value of "DiscardEntireSequence" indicates that the entire Sequence MUST be discarded if the

399 Sequence is closed, or terminated, when there are one or more gaps in the final

400 SequenceAcknowledgement.

A value of "DiscardFollowingFirstGap" indicates that messages in the Sequence beyond the first gap
 MUST be discarded when there are one or more gaps in the final SequenceAcknowledgement.

The default value of "NoDiscard" indicates that no acknowledged messages in the Sequence will be discarded.

405 /wsrm:CreateSequence/wsrm:Offer/{any}

This is an extensibility mechanism to allow different (extensible) types of information, based on a schema,to be passed.

408 /wsrm:CreateSequence/wsrm:Offer/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

411 /wsrm:CreateSequence/{any}

This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

414 /wsrm:CreateSequence/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

417 A CreateSequenceResponse is sent in the body of a response message by an RM Destination in

418 response to receipt of a CreateSequence request message. It carries the Identifier of the created

Sequence and indicates that the RM Source can begin sending messages in the context of the identified

420 Sequence.

421 The following exemplar defines the CreateSequenceResponse syntax:

422	<wsrm:createsequenceresponse></wsrm:createsequenceresponse>
423	<wsrm:identifier> xs:anyURI </wsrm:identifier>
424	<pre><wsrm:expires> xs:duration </wsrm:expires> ?</pre>

434 The following describes the content model of the CreateSequenceResponse element.

435 /wsrm:CreateSequenceResponse

436 This element is sent in the body of the response message in response to a CreateSequence request

437 message. It indicates that the RM Destination has created a new Sequence at the request of the RM

- 438 Source. The RM Destination MUST NOT send this element as a header block.
- 439 /wsrm:CreateSequenceResponse/wsrm:Identifier

440 The RM Destination MUST include this element within any CreateSequenceResponse message it sends.

441 The RM Destination MUST set the value of this element to the absolute URI (conformant with RFC3986)

- that uniquely identifies the Sequence that has been created by the RM Destination.
- 443 /wsrm:CreateSequenceResponse/wsrm:Identifier/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

446 /wsrm:CreateSequenceResponse/wsrm:Expires

447 This element, if present, of type xs:duration accepts or refines the RM Source's requested duration for

the Sequence. It specifies the amount of time after which any resources associated with the Sequence

⁴⁴⁹ SHOULD be reclaimed thus causing the Sequence to be silently terminated. At the RM Destination this

- 450 duration is measured from a point proximate to Sequence creation and at the RM Source this duration is
- 451 measured from a point approximate to the successful processing of the CreateSequenceResponse. A
- value of "PT0S" indicates that the Sequence will never expire. Absence of the element indicates an

implied value of "PT0S". The RM Destination MUST set the value of this element to be equal to or less
 than the value requested by the RM Source in the corresponding CreateSequence message.

455 /wsrm:CreateSequenceResponse/wsrm:Expires/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

- 458 /wsrm:CreateSequenceResponse/wsrm:IncompleteSequenceBehavior
- This element, if present, specifies the behavior that the destination will exhibit upon the closure or
- termination of an incomplete Sequence. For the purposes of defining the values used, the term "discard"
- refers to behavior equivalent to the Application Destination never processing a particular message.

462 A value of "DiscardEntireSequence" indicates that the entire Sequence MUST be discarded if the

- 463 Sequence is closed, or terminated, when there are one or more gaps in the final
- 464 SequenceAcknowledgement.
- A value of "DiscardFollowingFirstGap" indicates that messages in the Sequence beyond the first gap
 MUST be discarded when there are one or more gaps in the final SequenceAcknowledgement.
- The default value of "NoDiscard" indicates that no acknowledged messages in the Sequence will be discarded.
- 469 /wsrm:CreateSequenceResponse/wsrm:Accept
- This element, if present, enables an RM Destination to accept the offer of a corresponding Sequence for
- 471 the reliable exchange of messages Transmitted from RM Destination to RM Source.
- 472 Note: If a CreateSequenceResponse is returned without a child Accept in response to a
- 473 CreateSequence that did contain a child Offer, then the RM Source MAY immediately reclaim any
- 474 resources associated with the unused offered Sequence.
- 475 /wsrm:CreateSequenceResponse/wsrm:Accept/wsrm:AcksTo
- 476 The RM Destination MUST include this element, of type wsa:EndpointReferenceType (as specified
- 477 by WS-Addressing). It specifies the endpoint reference to which messages containing
- 478 SequenceAcknowledgement header blocks and faults related to the created Sequence are to be sent,
- unless otherwise noted in this specification (for example, see Section 3.5).
- 480 Implementations MUST NOT use an endpoint reference in the AcksTo element that would prevent the
- 481 sending of Sequence Acknowledgements back to the RM Source. For example, using the WS-Addressing
- ⁴⁸² "http://www.w3.org/2005/08/addressing/none" IRI would make it impossible for the RM Destination to ever
- 483 send Sequence Acknowledgements.
- 484 /wsrm:CreateSequenceResponse/wsrm:Accept/{any}
- This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.
- 487 /wsrm:CreateSequenceResponse/wsrm:Accept/@{any}
- This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.
- 490 /wsrm:CreateSequenceResponse/{any}
- This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

493 /wsrm:CreateSequenceResponse/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

496 3.5 Closing A Sequence

There are times during the use of an RM Sequence that the RM Source or RM Destination will wish to
discontinue using a Sequence. Simply terminating the Sequence discards the state managed by the RM
Destination, leaving the RM Source unaware of the final ranges of messages that were successfully
transferred to the RM Destination. To ensure that the Sequence ends with a known final state either the
RM Source or RM Destination MAY choose to close the Sequence before terminating it.

If the RM Source wishes to close the Sequence, then it sends a CloseSequence element, in the body of 502 a message, to the RM Destination. This message indicates that the RM Destination MUST NOT accept 503 any new messages for the specified Sequence, other than those already accepted at the time the 504 505 CloseSequence element is interpreted by the RM Destination. Upon receipt of this message, or subsequent to the RM Destination closing the Sequence of its own volition, the RM Destination MUST include a final SequenceAcknowledgement (within which the RM Destination MUST include the Final 507 element) header block on any messages associated with the Sequence destined to the RM Source, 508 including the CloseSequenceResponse message or on any Sequence fault Transmitted to the RM 509 510 Source.

511 While the RM Destination MUST NOT accept any new messages for the specified Sequence it MUST still

512 process Sequence Lifecyle Messages and Acknowledgement Requests. For example, it MUST respond to

513 AckRequested, TerminateSequence as well as CloseSequence messages. Note, subsequent

514 CloseSequence messages have no effect on the state of the Sequence.

515 In the case where the RM Destination wishes to discontinue use of a Sequence it is RECOMMENDED

that it close the Sequence. Please see ${\tt Final}$ and the ${\tt SequenceClosed}$ fault. Whenever possible the

517 SequenceClosed fault SHOULD be used in place of the <code>SequenceTerminated</code> fault to allow the RM

518 Source to still Receive Acknowledgements.

519 The following exemplar defines the CloseSequence syntax:

```
520<wsrm:CloseSequence ...>521<wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>522...523</wsrm:CloseSequence>
```

524 The following describes the content model of the CloseSequence element.

525 /wsrm:CloseSequence

526 This element is sent by an RM Source to indicate that the RM Destination MUST NOT accept any new

527 messages for this Sequence.

528 /wsrm:CloseSequence/wsrm:Identifier

529 The RM Source MUST include this element in any CloseSequence messages it sends. The RM Source

530 MUST set the value of this element to the absolute URI (conformant with RFC3986) of the Sequence that 531 is being closed.

532 /wsrm:CloseSequence/wsrm:Identifier/@{any}

533 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the 534 element. 535 /wsrm:CloseSequence/{any}

536 This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, 537 to be passed.

538 /wsrm:CloseSequence@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

541 A CloseSequenceResponse is sent in the body of a response message by an RM Destination in

response to receipt of a CloseSequence request message. It indicates that the RM Destination has closed the Sequence.

544 The following exemplar defines the CloseSequenceResponse syntax:

```
545<wsrm:CloseSequenceResponse</th>546<wsrm:Identifier</td>547...548</wsrm:CloseSequenceResponse>
```

549 The following describes the content model of the CloseSequenceResponse element.

550 /wsrm:CloseSequenceResponse

551 This element is sent in the body of a response message by an RM Destination in response to receipt of a

552 CloseSequence request message. It indicates that the RM Destination has closed the Sequence.

553 /wsrm:CloseSequenceResponse/wsrm:Identifier

⁵⁵⁴ The RM Destination MUST include this element in any CloseSequenceResponse message it sends. The

555 RM Destination MUST set the value of this element to the absolute URI (conformant with RFC3986) of the 556 Sequence that is being closed.

- 557 /wsrm:CloseSequenceResponse/wsrm:Identifier/@{any}
- 558 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the 559 element.
- 560 /wsrm:CloseSequenceResponse/{any}

This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

563 /wsrm:CloseSequenceResponse@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

566 3.6 Sequence Termination

567 When the RM Source has completed its use of the Sequence it sends a TerminateSequence element, 568 in the body of a message, to the RM Destination to indicate that the Sequence is complete and that it will 569 not be sending any further messages related to the Sequence. The RM Destination can safely reclaim any

- 570 resources associated with the Sequence upon receipt of the TerminateSequence message. Under
- 571 normal usage the RM Source will complete its use of the Sequence when all of the messages in the
- 572 Sequence have been acknowledged. However, the RM Source is free to Terminate or Close a Sequence
- 573 at any time regardless of the acknowledgement state of the messages.
- 574 The following exemplar defines the TerminateSequence syntax:

```
575 <wsrm:TerminateSequence ...>
576 <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
577 ...
578 </wsrm:TerminateSequence>
```

579 The following describes the content model of the TerminateSequence element.

580 /wsrm:TerminateSequence

⁵⁸¹ This element is sent by an RM Source to indicate it has completed its use of the Sequence. It indicates

that the RM Destination can safely reclaim any resources related to the identified Sequence. The RM

583 Source MUST NOT send this element as a header block. The RM Source MAY retransmit this element.

⁵⁸⁴ Once this element is sent, other than this element, the RM Source MUST NOT send any additional

585 message to the RM Destination referencing this Sequence.

586 /wsrm:TerminateSequence/wsrm:Identifier

⁵⁸⁷ The RM Source MUST include this element in any TerminateSequence message it sends. The RM

588 Source MUST set the value of this element to the absolute URI (conformant with RFC3986) of the

589 Sequence that is being terminated.

590 /wsrm:TerminateSequence/wsrm:Identifier/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

593 /wsrm:TerminateSequence/{any}

This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

596 /wsrm:TerminateSequence/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

599 A TerminateSequenceResponse is sent in the body of a response message by an RM Destination in

600 response to receipt of a TerminateSequence request message. It indicates that the RM Destination has

601 terminated the Sequence.

602 The following exemplar defines the TerminateSequenceResponse syntax:

603<wsrm:TerminateSequenceResponse</th>...>604<wsrm:Identifier</td>...> xs:anyURI </wsrm:Identifier>605...606</wsrm:TerminateSequenceResponse>

607 The following describes the content model of the TerminateSequence element.

608 /wsrm:TerminateSequenceResponse

⁶⁰⁹ This element is sent in the body of a response message by an RM Destination in response to receipt of a

610 TerminateSequence request message. It indicates that the RM Destination has terminated the

611 Sequence. The RM Destination MUST NOT send this element as a header block.

612 /wsrm:TerminateSequenceResponse/wsrm:Identifier

613 The RM Destination MUST include this element in any TerminateSequenceResponse message it

614 sends. The RM Destination MUST set the value of this element to the absolute URI (conformant with

615 RFC3986) of the Sequence that is being terminated.

616 /wsrm:TerminateSequenceResponse/wsrm:Identifier/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

619 /wsrm:TerminateSequenceResponse/{any}

This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

622 /wsrm:TerminateSequenceResponse/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

625 On receipt of a TerminateSequence message an RM Destination MUST respond with a corresponding

626 TerminateSequenceResponse message or generate a fault UnknownSequenceFault if the

627 Sequence is not known.

628 3.7 Sequences

629 The RM protocol uses a Sequence header block to track and manage the reliable transfer of messages.

REQUIRED. The RM Source MUST identify Sequences with unique Identifier elements and the RM

632 Source MUST assign each message within a Sequence a MessageNumber element that increments by 1

633 from an initial value of 1. These values are contained within a Sequence header block accompanying

each message being transferred in the context of a Sequence.

635 The RM Source MUST NOT include more than one Sequence header block in any message.

636 A following exemplar defines its syntax:

```
      637
      <wsrm:Sequence ...>

      638
      <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>

      639
      <wsrm:MessageNumber> wsrm:MessageNumberType </wsrm:MessageNumber>

      640
      ...

      641
      </wsrm:Sequence>
```

642 The following describes the content model of the Sequence header block.

643 /wsrm:Sequence

644 This protocol element associates the message in which it is contained with a previously established RM

645 Sequence. It contains the Sequence's unique identifier and the containing message's ordinal position

646 within that Sequence. The RM Destination MUST understand the Sequence header block. The RM

647 Source MUST assign a mustUnderstand attribute with a value 1/true (from the namespace

 $\,$ corresponding to the version of SOAP to which the ${\tt Sequence}$ SOAP header block is bound) to the

649 Sequence header block element.

650 /wsrm:Sequence/wsrm:Identifier

An RM Source that includes a Sequence header block in a SOAP envelope MUST include this element in that header block. The RM Source MUST set the value of this element to the absolute URI (conformant with RFC3986) that uniquely identifies the Sequence.

654 /wsrm:Sequence/wsrm:Identifier/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

657 /wsrm:Sequence/wsrm:MessageNumber

658 The RM Source MUST include this element within any Sequence headers it creates. This element is of

659 type MessageNumberType. It represents the ordinal position of the message within a Sequence.

660 Sequence message numbers start at 1 and monotonically increase by 1 throughout the Sequence. See

661 Section 4.5 for Message Number Rollover fault.

```
662 /wsrm:Sequence/{any}
```

⁶⁶² This is an extensibility mechanism to allow different types of information, based on a schema, to be ⁶⁶³ passed.

662 /wsrm:Sequence/@{any}

⁶⁶² This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the ⁶⁶³ element.

⁶⁶² The following example illustrates a Sequence header block.

```
662<wsrm:Sequence>662<wsrm:Identifier>http://example.com/abc</wsrm:Identifier>662<wsrm:MessageNumber>10</wsrm:MessageNumber>662</wsrm:Sequence>
```

662 3.8 Request Acknowledgement

662 The purpose of the AckRequested header block is to signal to the RM Destination that the RM Source is 663 requesting that a SequenceAcknowledgement be sent.

The RM Source MAY request an Acknowledgement Message from the RM Destination at any time by independently transmitting an AckRequested header block (i.e. as a header of a SOAP envelope with an empty body). Alternately the RM Source MAY include an AckRequested header block in any message targeted to the RM Destination. The RM Destination MUST detect and process any AckRequested header blocks that are piggy-backed on another message. If a non-mustUnderstand fault occurs when processing an AckRequested header block that was piggy-backed, a fault MUST be generated, but the processing of the original message MUST NOT be affected.

663 a message containing a SequenceAcknowledgement header block to the AcksTo endpoint reference

664 (see Section 3.4) for a known Sequence or else generate an UnknownSequence fault. It is

- 665 RECOMMENDED that the RM Destination return a AcknowledgementRange or None element instead
- 666 of a Nack element (see Section 3.9).

662 The following exemplar defines its syntax:

```
662<wsrm:AckRequested ...>662<wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>663...663</wsrm:AckRequested>
```

- 664 The following describes the content model of the AckRequested header block.
- 665 /wsrm:AckRequested

666 This element requests an Acknowledgement for the identified Sequence.

667 /wsrm:AckRequested/wsrm:Identifier

668 An RM Source that includes an AckRequested header block in a SOAP envelope MUST include this

- element in that header block. The RM Source MUST set the value of this element to the absolute URI,
- (conformant with RFC3986), that uniquely identifies the Sequence to which the request applies.

- 671 /wsrm:AckRequested/wsrm:Identifier/@{any}
- This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.
- 674 /wsrm:AckRequested/{any}

This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

677 /wsrm:AckRequested/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

680 3.9 Sequence Acknowledgement

681 The RM Destination informs the RM Source of successful message receipt using a

682 SequenceAcknowledgement header block. Acknowledgements can be explicitly requested using the

683 AckRequested directive (see Section 3.8).

684 The RM Destination MAY Transmit the SequenceAcknowledgement header block independently (i.e. as

a header of a SOAP envelope with an empty body). Alternatively, an RM Destination MAY include a

686 SequenceAcknowledgement header block on any SOAP envelope targeted to the endpoint referenced

687 by the AcksTo EPR. The RM Source MUST detect and process any SequenceAcknowledgement

header blocks that are piggy-backed on another message. If a non-mustUnderstand fault occurs when

689 processing a SequenceAcknowledgement header that was piggy-backed, a fault MUST be generated,

⁶⁹⁰ but the processing of the original message MUST NOT be affected.

- During creation of a Sequence the RM Source MAY specify the WS-Addressing anonymous IRI as the 691 address of the Acksto EPR for that Sequence. When the RM Source specifies the WS-Addressing 692 anonymous IRI as the address of the AcksTo EPR, the RM Destination MUST Transmit any 693 SequenceAcknowledgement headers for the created Sequence in a SOAP envelope to be Transmitted 694 on the protocol binding-specific back-channel. Such a channel is provided by the context of a Received message containing a SOAP envelope that contains a Sequence header block and/or an AckRequested 696 697 header block for that same Sequence identifier. When the RM Destination receives an AckRequested header, and the AckTo EPR for that sequence is the WS-Addressing anonymous IRI, the RM Destination 698 699 SHOULD respond on the protocol binding-specific back-channel provided by the Received message containing the AckRequested header block. 700
- 701 The following exemplar defines its syntax:

702	<pre><wsrm:sequenceacknowledgement></wsrm:sequenceacknowledgement></pre>			
703	<wsrm:identifier> xs:anyURI </wsrm:identifier>			
704	[[[<wsrm:acknowledgementrange< td=""></wsrm:acknowledgementrange<>			
705	Upper="wsrm:MessageNumberType"			
706	Lower="wsrm:MessageNumberType"/> +			
707	<pre> <wsrm:none></wsrm:none>]</pre>			
708	<wsrm:final></wsrm:final> ?]			
709	<pre> <wsrm:nack> wsrm:MessageNumberType </wsrm:nack> +]</pre>			
710				
711				
712				

713 The following describes the content model of the SequenceAcknowledgement header block.

714 /wsrm:SequenceAcknowledgement

- 715 This element contains the Sequence Acknowledgement information.
- 716 /wsrm:SequenceAcknowledgement/wsrm:Identifier
- 717 An RM Destination that includes a SequenceAcknowledgement header block in a SOAP envelope
- 718 MUST include this element in that header block. The RM Destination MUST set the value of this element
- to the absolute URI (conformant with RFC3986) that uniquely identifies the Sequence. The RM
- 720 Destination MUST NOT include multiple SequenceAcknowledgement header blocks that share the
- 721 same value for Identifier within the same SOAP envelope.
- 722 /wsrm:SequenceAcknowledgement/wsrm:Identifier/@{any}
- This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.
- 725 /wsrm:SequenceAcknowledgement/wsrm:AcknowledgementRange
- 726 The RM Destination MAY include one or more instances of this element within a
- 727 SequenceAcknowledgement header block. It contains a range of Sequence message numbers
- ⁷²⁸ successfully accepted by the RM Destination. The ranges MUST NOT overlap. The RM Destination
- 729 MUST NOT include this element if a sibling Nack or None element is also present as a child of
- 730 SequenceAcknowledgement.
- 731 /wsrm:SequenceAcknowledgement/wsrm:AcknowledgementRange/@Upper
- The RM Destination MUST set the value of this attribute equal to the message number of the highest
- contiguous message in a Sequence range accepted by the RM Destination.
- 734 /wsrm:SequenceAcknowledgement/wsrm:AcknowledgementRange/@Lower
- 735 The RM Destination MUST set the value of this attribute equal to the message number of the lowest
- r36 contiguous message in a Sequence range accepted by the RM Destination.
- 737 /wsrm:SequenceAcknowledgement/wsrm:AcknowledgementRange/@{any}
- This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.
- 740 /wsrm:SequenceAcknowledgement/wsrm:None
- 741 The RM Destination MUST include this element within a SequenceAcknowledgement header block if
- the RM Destination has not accepted any messages for the specified Sequence. The RM Destination
- 743 MUST NOT include this element if a sibling AcknowledgementRange or Nack element is also present
- 744 as a child of the SequenceAcknowledgement.
- 745 /wsrm:SequenceAcknowledgement/wsrm:Final
- 746 The RM Destination MAY include this element within a SequenceAcknowledgement header block. This
- r47 element indicates that the RM Destination is not receiving new messages for the specified Sequence. The
- 748 RM Source can be assured that the ranges of messages acknowledged by this
- 749 SequenceAcknowledgement header block will not change in the future. The RM Destination MUST
- ⁷⁵⁰ include this element when the Sequence is closed. The RM Destination MUST NOT include this element
- 751 when sending a Nack; it can only be used when sending AcknowledgementRange elements or a None.
- 752 /wsrm:SequenceAcknowledgement/wsrm:Nack
- 753 The RM Destination MAY include this element within a SequenceAcknowledgement header block. If
- 754 used, the RM Destination MUST set the value of this element to a MessageNumberType representing
- 755 the MessageNumber of an unreceived message in a Sequence. The RM Destination MUST NOT include

756 a Nack element if a sibling AcknowledgementRange or None element is also present as a child of

757 SequenceAcknowledgement. Upon the receipt of a <code>Nack</code>, an RM Source SHOULD retransmit the

758 message identified by the Nack. The RM Destination MUST NOT issue a SequenceAcknowledgement

 $_{\rm 759}$ containing a $_{\rm Nack}$ for a message that it has previously acknowledged within a

760 AcknowledgementRange. The RM Source SHOULD ignore a SequenceAcknowledgement containing

- 761 a Nack for a message that has previously been acknowledged within a AcknowledgementRange.
- 762 /wsrm:SequenceAcknowledgement/{any}
- This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.
- 765 /wsrm:SequenceAcknowledgement/@{any}
- This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.
- 768 The following examples illustrate SequenceAcknowledgement elements:
- Message numbers 1...10 inclusive in a Sequence have been accepted by the RM Destination.

```
770
        <wsrm:SequenceAcknowledgement>
771
             <wsrm:Identifier>http://example.com/abc</wsrm:Identifier>
             <wsrm:AcknowledgementRange Upper="10" Lower="1"/>
772
773
         </wsrm:SequenceAcknowledgement>
774

    Message numbers 1..2, 4..6, and 8..10 inclusive in a Sequence have been accepted by the RM

         Destination, messages 3 and 7 have not been accepted.
775
776
        <wsrm:SequenceAcknowledgement>
777
             <wsrm:Identifier>http://example.com/abc</wsrm:Identifier>
778
             <wsrm:AcknowledgementRange Upper="2" Lower="1"/>
             <wsrm:AcknowledgementRange Upper="6" Lower="4"/>
779
             <wsrm:AcknowledgementRange Upper="10" Lower="8"/>
780
781
         </wsrm:SequenceAcknowledgement>
```

• Message number 3 in a Sequence has not been accepted by the RM Destination.

```
783 <wsrm:SequenceAcknowledgement>
784 <wsrm:Identifier>http://example.com/abc</wsrm:Identifier>
785 <wsrm:Nack>3</wsrm:Nack>
786 </wsrm:SequenceAcknowledgement>
```

787 3.10 MakeConnection

When an Endpoint is not directly addressable (e.g. behind a firewall or not able to allow incoming
connections), an anonymous URI in the EPR address property can indicate such an Endpoint. The WSAddressing anonymous URI is one such anonymous URI. This specification defines a URI template (the
WS-RM anonymous URI) which may be used to uniquely identify anonymous Endpoints.

792 http://docs.oasis-open.org/ws-rx/wsrm/200608/anonymous?id={uuid}

This URI template in an EPR indicates a protocol-specific back-channel will be established through a mechanism such as MakeConnection, defined below. When using this URI template, "{uuid}" MUST be replaced by a UUID value as defined by RFC4122[UUID]. This UUID value uniquely distinguishes the Endpoint. A sending Endpoint SHOULD Transmit messages at Endpoints identified with the URI template using a protocol-specific back-channel, including but not limited to those established with a MakeConnection message. Note, this URI is semantically similar to the WS-Addressing anonymous URI if a protocol-specific back-channel is available.

- 800 The MakeConnection element is sent in the body of a one-way message that establishes a
- 801 contextualized back-channel for the transmission of messages according to matching criteria (defined
- below). In the non-faulting case, if no matching message is available then no SOAP envelope will be
- returned on the back-channel. A common usage will be a client RM Destination sending
- $\tt 804$ $\tt MakeConnection$ to a server RM Source for the purpose of receiving asynchronous response
- 805 messages.

806 The following exemplar defines the MakeConnection syntax:

- 812 The following describes the content model of the MakeConnection element.
- 813 /wsrm:MakeConnection

This element allows the sender to create a transport-specific back-channel that can be used to return a

815 message that matches the selection criteria. Endpoints MUST NOT send this element as a header block.

816 /wsrm:MakeConnection/wsrm:Identifier

817 This element specifies the WS-RM Sequence Identifier that establishes the context for the transport-

818 specific back-channel. The Sequence Identifier should be compared with the Sequence Identifiers

associated with the messages held by the sending Endpoint, and if there is a matching message it will be

- returned. If this element is omitted from the message then the Address MUST be included in the
- 821 message.

822 /wsrm:MakeConnection/wsrm:Identifier/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

825 /wsrm:MakeConnection/wsrm:Address

This element specifies the URI (wsa:Address) of the initiating Endpoint. Endpoints MUST NOT return messages on the transport-specific back-channel unless they have been addressed to this URI. This Address property and a message's WS-Addressing destination property are considered identical when they are exactly the same character-for-character. Note that URIs which are not identical in this sense may in fact be functionally equivalent. Examples include URI references which differ only in case, or which are in external entities which have different effective base URIs. If this element is omitted from the

 $\tt 832$ message then the <code>Identifier</code> MUST be included in the message.

833 /wsrm:MakeConnection/wsrm:Address/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

836 /wsrm:MakeConnection/{any}

- 837 This is an extensibility mechanism to allow different (extensible) types of information, based on a schema,
- to be passed. This allows fine-tuning of the messages to be returned, additional selection criteria included
- 839 here are logically ANDed with the Address and/or Identifier. If an extension is not supported by the
- 840 Endpoint then it should generate an UnsupportedSelection fault.

841 /wsrm:MakeConnection/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

844 If both Identifier and Address are present, then the Endpoint processing the MakeConnection 845 message MUST insure that any SOAP Envelope flowing on the back-channel MUST be associated with

846 the given Sequence and MUST be addressed to the given URI.

847 The management of messages that are awaiting the establishment of a back-channel to their receiving

848 Endpoint is an implementation detail that is outside the scope of this specification. Note, however, that

these messages form a class of asynchronous messages that is not dissimilar from "ordinary"

asynchronous messages that are waiting for the establishment of a connection to their destination

851 Endpoints.

852 This specification places no constraint on the types of messages that can be returned on the transport-

specific back-channel. As in an asynchronous environment, it is up to the recipient of the

854 MakeConnection message to decide which messages are appropriate for transmission to any particular

855 Endpoint. However, the Endpoint processing the MakeConnection message MUST insure that the

messages match the selection criteria as specified by the child elements of the MakeConnection
 element.

Since the message exchange pattern use by MakeConnection is untraditional, the following points need to be reiterated for clarification:

The MakeConnection message is logically part of a one-way operation; there is no reply
 message to the MakeConnection itself, and any response flowing on the transport back-channel
 is a pending message.

Since there is no reply message to MakeConnection, the WS-Addressing specific rules in
 section 3.4 "Formulating a Reply Message" are not used. Therefore, the value of any
 wsa:ReplyTo element in the MakeConnection message has no effective impact since the WS-Addressing [reply endpoint] property that is set by the presence of wsa:ReplyTo is not
 used.

- In the absence of any pending message, there will be no message transmitted on the transport
 back-channel. E.g. In the HTTP case just an HTTP 202 Accepted will be returned without any
 SOAP envelope in the HTTP response message.
- When there is a message pending, it is sent on the transport back-channel, using the connection
 that has been initiated by the MakeConnection request.

873 3.11 MessagePending

When MakeConnection is used, and a message is returned on the transport-specific back-channel, the MessagePending header SHOULD be included on the returned message as an indicator whether there are additional messages waiting to be retrieved using the same selection criteria that was specified in the MakeConnection element.

878 The following exemplar defines the MessagePending syntax:

879
</wsrm:MessagePending pending="xs:boolean" ...>
880
...
881
</wsrm:MessagePending>

882 The following describes the content model of the MessagePending header block.

883 /wsrm:MessagePending

- 884 This element indicates whether additional messages are waiting to be retrieved.
- 885 /wsrm:MessagePending@pending
- 886 This attribute, when set to "true", indicates that there is at least one message waiting to be retrieved.
- 887 When this attribute is set to "false" it indicates there are currently no messages waiting to be retrieved.
- 888 /wsrm:MessagePending/{any}
- This is an extensibility mechanism to allow different (extensible) types of information, based on a schema,to be passed.
- 891 /wsrm:MessagePending/@{any}
- This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.
- 894 The absence of the MessagePending header has no implication as to whether there are additional 895 messages waiting to be retrieved.

896 4 Faults

Faults for the CreateSequence message exchange are treated as defined in WS-Addressing. Create 897 Sequence Refused is a possible fault reply for this operation. Unknown Sequence is a fault generated by 898 Endpoints when messages carrying RM header blocks targeted at unrecognized or terminated Seguences 899 are detected. WSRM Required is a fault generated an RM Destination that requires the use of WS-RM on 900 a Received message that did not use the protocol. All other faults in this section relate to known 901 Sequences. Destinations that generate faults related to known sequences SHOULD transmit those faults. 902 903 If transmitted, such faults MUST be transmitted to the same [destination] as Acknowledgement messages. 904

Entities that generate WS-ReliableMessaging faults MUST include as the [action] property the default fault action IRI defined below. The value from the W3C Recommendation is below for informational purposes:

907 http://docs.oasis-open.org/ws-rx/wsrm/200608/fault

The faults defined in this section are generated if the condition stated in the preamble is met. Fault handling rules are defined in section 6 of WS-Addressing SOAP Binding.

- 910 The definitions of faults use the following properties:
- 911 [Code] The fault code.
- 912 [Subcode] The fault subcode.
- 913 [Reason] The English language reason element.
- 914 [Detail] The detail element(s). If absent, no detail element is defined for the fault. If more than one detail
- element is defined for a fault, implementations MUST include the elements in the order that they arespecified.
- 917 Entities that generate WS-ReliableMessaging faults MUST set the [Code] property to either "Sender" or
- 918 "Receiver". These properties are serialized into text XML as follows:

SOAP Version	on Sender Receiver	
SOAP 1.1	S11:Client	S11:Server
SOAP 1.2	S:Sender	S:Receiver

919 The properties above bind to a SOAP 1.2 fault as follows:

920	<s:envelope></s:envelope>
921	<s:header></s:header>
922	<wsa:action></wsa:action>
923	http://docs.oasis-open.org/ws-rx/wsrm/200608/fault
924	
925	Headers elided for brevity
926	
927	<s:body></s:body>
928	<s:fault></s:fault>
929	<s:code></s:code>
930	<s:value> [Code] </s:value>
931	<s:subcode></s:subcode>
932	<s:value> [Subcode] </s:value>
933	
934	
935	<s:reason></s:reason>
936	<s:text xml:lang="en"> [Reason] </s:text>
937	
938	<s:detail></s:detail>

939	[Detail]
940	
941	
942	
943	
944	

The properties above bind to a SOAP 1.1 fault as follows when the fault is triggered by processing an RM header block:

```
<S11:Envelope>
947
948
         <S11:Header>
949
            <wsrm:SequenceFault>
              <wsrm:FaultCode> wsrm:FaultCodes </wsrm:FaultCode>
950
              <wsrm:Detail> [Detail] </wsrm:Detail>
951
952
              . . .
953
           </wsrm:SequenceFault>
954
           <!-- Headers elided for brevity. -->
955
         </S11:Header>
956
         <S11:Body>
957
          <S11:Fault>
958
           <faultcode> [Code] </faultcode>
959
           <faultstring> [Reason] </faultstring>
960
          </S11:Fault>
961
         </S11:Bodv>
        </S11:Envelope>
962
```

⁹⁶³ The properties bind to a SOAP 1.1 fault as follows when the fault is generated as a result of processing a

964 CreateSequence request message:

```
<S11:Envelope>
965
         <S11:Body>
966
967
           <S11:Fault>
            <faultcode> [Subcode] </faultcode>
968
969
            <faultstring> [Reason] </faultstring>
970
           </S11:Fault>
971
         </S11:Body>
         </S11:Envelope>
972
```

973 4.1 SequenceFault Element

The purpose of the SequenceFault element is to carry the specific details of a fault generated during the reliable messaging specific processing of a message belonging to a Sequence. WS-

976 ReliableMessaging nodes MUST use the SequenceFault container only in conjunction with the SOAP

1.1 fault mechanism. WS-ReliableMessaging nodes MUST NOT use the SequenceFault container in conjunction with the SOAP 1.2 binding.

979 The following exemplar defines its syntax:

```
980 <wsrm:SequenceFault ...>
981 <wsrm:FaultCode> wsrm:FaultCodes </wsrm:FaultCode>
982 <wsrm:Detail> ... </wsrm:Detail> ?
983 ...
984 </wsrm:SequenceFault>
```

- 985 The following describes the content model of the SequenceFault element.
- 986 /wsrm:SequenceFault
- 987 This is the element containing Sequence information for WS-ReliableMessaging

- 988 /wsrm:SequenceFault/wsrm:FaultCode
- 989 WS-ReliableMessaging nodes that generate a SequenceFault MUST set the value of this element to a
- 990 qualified name from the set of fault [Subcodes] defined below.
- 991 /wsrm:SequenceFault/wsrm:Detail
- ⁹⁹² This element, if present, carries application specific error information related to the fault being described.
- 993 /wsrm:SequenceFault/wsrm:Detail/{any}
- ⁹⁹⁴ The application specific error information related to the fault being described.
- 995 /wsrm:SequenceFault/wsrm:Detail/@{any}
- ⁹⁹⁶ The application specific error information related to the fault being described.
- 997 /wsrm:SequenceFault/{any}
- This is an extensibility mechanism to allow different (extensible) types of information, based on a schema,to be passed.
- 1000 /wsrm:SequenceFault/@{any}
- 1001 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the 1002 element.

1003 4.2 Sequence Terminated

1004 The Endpoint that generates this fault SHOULD make every reasonable effort to notify the corresponding 1005 Endpoint of this decision.

- 1006 Properties:
- 1007 [Code] Sender or Receiver
- 1008 [Subcode] wsrm:SequenceTerminated
- 1009 [Reason] The Sequence has been terminated due to an unrecoverable error.
- 1010 [Detail]
- 1011 <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>

Generated by	Condition	Action Upon Generation	Action Upon Receipt
RM Source or RM Destination.	Encountering an unrecoverable condition or detection of violation of the protocol.	Sequence termination.	MUST terminate the Sequence if not otherwise terminated.

1012 4.3 Unknown Sequence

- 1013 Properties:
- 1014 [Code] Sender
- 1015 [Subcode] wsrm:UnknownSequence

- 1016 [Reason] The value of wsrm:Identifier is not a known Sequence identifier.
- 1017 [Detail]

1018 <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>

Generated by	Condition	Action Upon Generation	Action Upon Receipt
RM Source or RM Destination.	In response to a message containing an unknown or terminated Sequence identifier.	None.	MUST terminate the Sequence if not otherwise terminated.

1019 4.4 Invalid Acknowledgement

- 1020 An example of when this fault is generated is when a message is Received by the RM Source containing
- 1021 a SequenceAcknowledgement covering messages that have not been sent.
- 1022 [Code] Sender
- 1023 [Subcode] wsrm:InvalidAcknowledgement
- 1024 [Reason] The SequenceAcknowledgement violates the cumulative Acknowledgement invariant.
- 1025 [Detail]
- 1026

<wsrm:SequenceAcknowledgement ...> ... </wsrm:SequenceAcknowledgement>

Generated by	Condition	Action Upon Generation	Action Upon Receipt
RM Source.	In response to a SequenceAknowledge ment that violate the invariants stated in 2.3 or any of the requirements in 3.9 about valid combinations of AckRange, Nack and None in a single SequenceAcknowledg ement element or with respect to already Received such elements.	Unspecified.	Unspecified.

1027 4.5 Message Number Rollover

- ¹⁰²⁸ If the condition listed below is reached, the RM Destination MUST generate this fault.
- 1029 Properties:
- 1030 [Code] Sender
- 1031 [Subcode] wsrm:MessageNumberRollover
- 1032 [Reason] The maximum value for wsrm:MessageNumber has been exceeded.

1033 [Detail]

1034 1035 <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier> <wsrm:MaxMessageNumber> wsrm:MessageNumberType </wsrm:MaxMessageNumber>

Generated by	Condition	Action Upon Generation	Action Upon Receipt
RM Destination.	Message number in /wsrm:Sequence/wsr m:MessageNumber of a Received message exceeds the internal limitations of an RM Destination or reaches the maximum value of 9,223,372,036,854,775,8 07.	RM Destination SHOULD continue to accept undelivered messages until the Sequence is closed or terminated.	RM Source SHOULD continue to retransmit undelivered messages until the Sequence is closed or terminated.

1036 4.6 Create Sequence Refused

- 1037 Properties:
- 1038 [Code] Sender or Receiver
- 1039 [Subcode] wsrm:CreateSequenceRefused
- 1040 [Reason] The Create Sequence request has been refused by the RM Destination.
- 1041 [Detail]
- 1042 xs:any

Generated by	Condition	Action Upon Generation	Action Upon Receipt
RM Destination.	In response to a CreateSequence message when the RM Destination does not wish to create a new Sequence.	Unspecified.	Sequence terminated.

1043 4.7 Sequence Closed

1044 This fault is generated by an RM Destination to indicate that the specified Sequence has been closed.

- 1045 This fault MUST be generated when an RM Destination is asked to accept a message for a Sequence that 1046 is closed.
- 1047 Properties:
- 1048 [Code] Sender
- 1049 [Subcode] wsrm:SequenceClosed
- 1050 [Reason] The Sequence is closed and can not accept new messages.

1051 [Detail]

1052

<wsrm:Identifier...> xs:anyURI </wsrm:Identifier>

Generated by	Condition	Action Upon Generation	Action Upon Receipt
RM Destination.	In response to a message that belongs to a Sequence that is already closed.	Unspecified.	Sequence closed.

1053 4.8 WSRM Required

If an RM Destination requires the use of WS-RM, this fault is generated when it Receives an incomingmessage that did not use this protocol.

- 1056 Properties:
- 1057 [Code] Sender
- 1058 [Subcode] wsrm:WSRMRequired
- 1059 [Reason] The RM Destination requires the use of WSRM.
- 1060 [Detail]
- 1061 xs:any

Generated by	Condition	Action Upon Generation	Action Upon Receipt
RM Destination.	On receipt of a message that does not use this protocol and for which this protocol is required.	Unspecified.	Unspecified.

1062 4.9 Unsupported Selection

- 1063 The QName of the unsupported element(s) are included in the detail.
- 1064 Properties:
- 1065 [Code] Receiver
- 1066 [Subcode] wsrm:UnsupportedSelection
- 1067 [Reason] The extension element used in the message selection is not supported by the RM Source
- 1068 [Detail]
- 1069

<wsrm:UnsupportedElement> xs:QName </wsrm:UnsupportedElement>+

Generated by	Condition	Action Upon Generation	Action Upon Receipt
RM Source or RM Destination.	In response to a MakeConnection message containing a selection criteria in the extensibility section of the message that is not supported	Unspecified.	Unspecified.

1070 5 Security Threats and Countermeasures

1071 This specification considers two sets of security requirements, those of the applications that use the WS-1072 RM protocol and those of the protocol itself.

This specification makes no assumptions about the security requirements of the applications that use WSRM. However, once those requirements have been satisfied within a given operational context, the
addition of WS-RM to this operational context should not undermine the fulfillment of those requirements;
the use of WS-RM should not create additional attack vectors within an otherwise secure system.

There are many other security concerns that one may need to consider when implementing or using this
protocol. The material below should not be considered as a "check list". Implementers and users of this
protocol are urged to perform a security analysis to determine their particular threat profile and the
appropriate responses to those threats.

Implementers are also advised that there is a core tension between security and reliable messaging that 1081 can be problematic if not addressed by implementations; one aspect of security is to prevent message 1082 replay but one of the invariants of this protocol is to resend messages until they are acknowledged. 1083 Consequently, if the security sub-system processes a message but a failure occurs before the reliable 1084 messaging sub-system Receives that message, then it is possible (and likely) that the security sub-system 1085 will treat subsequent copies as replays and discard them. At the same time, the reliable messaging sub-1086 system will likely continue to expect and even solicit the missing message(s). Care should be taken to 1087 avoid and prevent this condition. 1088

1089 5.1 Threats and Countermeasures

The primary security requirement of this protocol is to protect the specified semantics and protocol
invariants against various threats. The following sections describe several threats to the integrity and
operation of this protocol and provide some general outlines of countermeasures to those threats.
Implementers and users of this protocol should keep in mind that all threats are not necessarily applicable
to all operational contexts.

1095 5.1.1 Integrity Threats

In general, any mechanism which allows an attacker to alter the information in a Sequence Traffic
Message, Sequence Lifecycle Message, Acknowledgement Messages, Acknowledgement Request, or
Sequence-related fault, or which allows an attacker to alter the correlation of a RM Protocol Header Block
to its intended message represents a threat to the WS-RM protocol.

For example, if an attacker is able to swap Sequence headers on messages in transit between the RM
Source and RM Destination then they have undermined the implementation's ability to guarantee the first
invariant described in Section 2.3. The result is that there is no way of guaranteeing that messages will be
Delivered to the Application Destination in the same order that they were sent by the Application Source.

1104 5.1.1.1 Countermeasures

Integrity threats are generally countered via the use of digital signatures some level of the communication protocol stack. Note that, in order to counter header swapping attacks, the signature SHOULD include both the SOAP body and any relevant SOAP headers (e.g. sequence header). Because some headers (AckRequested, SequenceAcknowledgement) are independent of the body of the SOAP message in which they occur, implementations MUST allow for signatures that cover only these headers.

1110 5.1.2 Resource Consumption Threats

1111 The creation of a Sequence with an RM Destination consumes various resources on the systems used to

1112 implement that RM Destination. These resources can include network connections, database tables,

1113 message queues, etc. This behavior can be exploited to conduct denial of service attacks against an RM

1114 Destination. For example, a simple attack is to repeatedly send CreateSequence messages to an RM

1115 Destination. Another attack is to create a Sequence for a service that is known to require in-order

1116 message Delivery and use this Sequence to send a stream of very large messages to that service,

1117 making sure to omit message number "1" from that stream.

1118 5.1.2.1 Countermeasures

1119 There are a number of countermeasures against the described resource consumption threats. The

1120 technique advocated by this specification is for the RM Destination to restrict the ability to create a

1121 Sequence to a specific set of entities/principals. This reduces the number of potential attackers and, in

1122 some cases, allows the identity of any attackers to be determined.

1123 The ability to restrict Sequence creation depends, in turn, upon the RM Destination's ability identify and 1124 authenticate the RM Source that issued the CreateSequence message.

1125 5.1.3 Sequence Spoofing Threats

Sequence spoofing is a class of threats in which the attacker uses knowledge of the Identifier for a particular Sequence to forge Sequence Lifecycle or Traffic Messages. For example the attacker creates a fake TerminateSequence message that references the target Sequence and sends this message to the appropriate RM Destination. Some sequence spoofing attacks also require up-to-date knowledge of the current MessageNumber for their target Sequence.

In general any Sequence Lifecycle Message, RM Protocol Header Block, or sequence-correlated SOAP
 fault (e.g. InvalidAcknowledgement) can be used by someone with knowledge of the Sequence identifier
 to attack the Sequence. These attacks are "two-way" in that an attacker may choose to target the RM

1134 Source by, for example, inserting a fake <code>SequenceAcknowledgement</code> header into a message that it sends

1135 to the AcksTo EPR of an RM Source.

1136 5.1.3.1 Sequence Hijacking

1137 Sequence hijacking is a specific case of a sequence spoofing attack. The attacker attempts to inject

1138 Sequence Traffic Messages into an existing Sequence by inserting fake sequence headers into those 1139 messages.

Note that "sequence hijacking" should not be equated with "security session hijacking". Although a Sequence may be bound to some form of a security session in order to counter the threats described in this section, applications MUST NOT rely on WS-RM-related information to make determinations about the identity of the entity that created a message; applications SHOULD rely only upon information that is established by the security infrastructure to make such determinations. Failure to observe this rule creates, among other problems, a situation in which the absence of WS-RM may deprive an application of the ability to authenticate its peers even though the necessary security processing has taken place.

1147 5.1.3.2 Countermeasures

1148 There are a number of countermeasures against sequence spoofing threats. The technique advocated by 1149 this specification is to consider the Sequence to be a shared resource that is jointly owned by the RM 1150 Source that initiated its creation (i.e. that sent the CreateSequence message) and the RM Destination that

1151 serves as its terminus (i.e. that sent the CreateSequenceResponse message). To counter sequence

1152 spoofing attempts the RM Destination SHOULD ensure that every message or fault that it Receives that

1153 refers to a particular Sequence originated from the RM Source that jointly owns the referenced Sequence.

For its part the RM Source SHOULD ensure that every message or fault that it Receives that refers to a particular Sequence originated from the RM Destination that jointly owns the referenced Sequence.

1156 For the RM Destination to be able to identify its sequence peer it MUST be able to identify and

1157 authenticate the entity that sent the CreateSequence message. Similarly for the RM Source to identify its

sequence peer it MUST be able to identify and authenticate the entity that sent the

1159 CreateSequenceResponse message. For either the RM Destination or the RM Source to determine if a

1160 message was sent by its sequence peer it MUST be able to identify and authenticate the initiator of that

1161 message and, if necessary, correlate this identity with the sequence peer identity established at sequence 1162 creation time.

1163 5.2 Security Solutions and Technologies

The security threats described in the previous sections are neither new nor unique. The solutions that
have been developed to secure other SOAP-based protocols can be used to secure WS-RM as well. This
section maps the facilities provided by common web services security solutions against countermeasures
described in the previous sections.

Before continuing this discussion, however, some examination of the underlying requirements of the previously described countermeasures is necessary. Specifically it should be noted that the technique described in Section 5.1.2.1 has two components. Firstly, the RM Destination identifies and authenticates the issuer of a CreateSequence message. Secondly, the RM Destination performs an authorization check against this authenticated identity and determines if the RM Source is permitted to create Sequences with the RM Destination. Since the facilities for performing this authorization check (runtime infrastructure, policy frameworks, etc.) lie completely within the domain of individual implementations, any discussion of

1175 such facilities is considered to be beyond the scope of this specification.

1176 5.2.1 Transport Layer Security

1177 This section describes how the facilities provided by SSL/TLS [RFC 4346] can be used to implement the 1178 countermeasures described in the previous sections. The use of SSL/TLS is subject to the constraints 1179 defined in Section 4 of the Basic Security Profile 1.0 [BSP 1.0].

The description provided here is general in nature and is not intended to serve as a complete definition on the use of SSL/TLS to protect WS-RM. In order to interoperate implementations need to agree on the choice of features as well as the manner in which they will be used. The mechanisms described in the Web Services Security Policy Language [SecurityPolicy] MAY be used by services to describe the requirements and constraints of the use of SSL/TLS.

1185 5.2.1.1 Model

1186 The basic model for using SSL/TLS is as follows:

- 1187 1. The RM Source establishes an SSL/TLS session with the RM Destination.
- 11882. The RM Source uses this SSL/TLS session to send a CreateSequence message to the RM1189Destination.

- The RM Destination establishes an SSL/TLS session with the RM Source and sends an
 asynchronous CreateSequenceResponse using this session. Alternately it may respond with a
 synchronous CreateSequenceResponse using the session established in (1).
- 4. For the lifetime of the Sequence the RM Source uses the SSL/TLS session from (1) to Transmit
 any and all messages or faults that refer to that Sequence.
- For the lifetime of the Sequence the RM Destination either uses the SSL/TLS session established
 in (3) to Transmit any and all messages or faults that refer to that Sequence or, for synchronous
 exchanges, the RM Destination uses the SSL/TLS session established in (1).

1198 5.2.1.2 Countermeasure Implementation

Used in its simplest fashion (without relying upon any authentication mechanisms), SSL/TLS provides the
necessary integrity qualities to counter the threats described in Section 5.1.1. Note, however, that the
nature of SSL/TLS limits the scope of this integrity protection to a single transport level session. If
SSL/TLS is the only mechanism used to provide integrity, any intermediaries between the RM Source and
the RM Destination MUST be trusted to preserve the integrity of the messages that flow through them.

As noted, the technique described in Sections 5.1.2.1 involves the use of authentication. This specification
advocates either of two mechanisms for authenticating entities using SSL/TLS. In both of these methods
the SSL/TLS server (the party accepting the SSL/TLS connection) authenticates itself to the SSL/TLS
client using an X.509 certificate that is exchanged during the SSL/TLS handshake.

- HTTP Basic Authentication: This method of authentication presupposes that a SOAP/HTTP
 binding is being used as part of the protocol stack beneath WS-RM. Subsequent to the
 establishment of the SSL/TLS session, the sending party authenticates itself to the receiving party
 using HTTP Basic Authentication [RFC 2617]. For example, a RM Source might authenticate itself
 to a RM Destination (e.g. when transmitting a Sequence Traffic Message) using BasicAuth.
 Similarly the RM Destination might authenticate itself to the RM Source (e.g. when sending an
 Acknowledgement) using BasicAuth.
- SSL/TLS Client Authentication: In this method of authentication, the party initiating the
 connection authenticates itself to the party accepting the connection using an X.509 certificate
 that is exchanged during the SSL/TLS handshake.

1218 To implement the countermeasures described in section 5.1.2.1 the RM Source must authenticate itself 1219 using one the above mechanisms. The authenticated identity can then be used to determine if the RM 1220 Source is authorized to create a Sequence with the RM Destination.

This specification advocates implementing the countermeasures described in section 5.1.3.2 by requiring 1221 1222 an RM node's Sequence peer to be equivalent to their SSL/TLS session peer. This allows the authorization decisions described in section 5.1.3.2 to be based on SSL/TLS session identity rather than 1223 1224 on authentication information. For example, an RM Destination can determine that a Sequence Traffic Message rightfully belongs to its referenced Sequence if that message arrived over the same SSL/TLS 1225 1226 session that was used to carry the CreateSequence message for that Sequence. Note that requiring a one-to-one relationship between SSL/TLS session peer and Sequence peer constrains the lifetime of a 1227 SSL/TLS-protected Sequence to be less than or equal to the lifetime of the SSL/TLS session that is used 1228 1229 to protect that Sequence.

- 1230 This specification does not preclude the use of other methods of using SSL/TLS to implement the
- 1231 countermeasures (such as associating specific authentication information with a Sequence) although such 1232 methods are not covered by this document.

1233 Issues specific to the life-cycle management of SSL/TLS sessions (such as the resumption of a SSL/TLS1234 session) are outside the scope of this specification.

1235 **5.2.2 SOAP Message Security**

1236 The mechanisms described in WS-Security may be used in various ways to implement the

1237 countermeasures described in the previous sections. This specification advocates using the protocol

1238 described by WS-SecureConversation [SecureConversation] (optionally in conjunction with WS-Trust

1239 [Trust]) as a mechanism for protecting Sequences. The use of WS-Security (as an underlying component

of WS-SecureConversation) is subject to the constraints defined in the Basic Security Profile 1.0.

1241 The description provided here is general in nature and is not intended to serve as a complete definition on

1242 the use of WS-SecureConversation/WS-Trust to protect WS-RM. In order to interoperate implementations

1243 need to agree on the choice of features as well as the manner in which they will be used. The

1244 mechanisms described in the Web Services Security Policy Language MAY be used by services to

1245 describe the requirements and constraints of the use of WS-SecureConversation.

1246 **5.2.2.1 Model**

1247 The basic model for using WS-SecureConversation is as follows:

 The RM Source and the RM Destination create a WS-SecureConversation security context. This 1248 may involve the participation of third parties such as a security token service. The tokens 1249 exchanged may contain authentication claims (e.g. X.509 certificates or Kerberos service tickets). 1250 During the CreateSequence exchange, the RM Source SHOULD explicitly identify the security 1251 context that will be used to protect the Sequence. This is done so that, in cases where the 1252 CreateSequence message is signed by more than one security context, the RM Source can 1253 indicate which security context should be used to protect the newly created Sequence. 1254 3. For the lifetime of the Sequence the RM Source and the RM Destination use the session key(s) 1255 associated with the security context to sign (as defined by WS-Security) at least the body and any 1256

relevant WS-RM-defined headers of any and all messages or faults that refer to that Sequence.

1258 5.2.2.2 Countermeasure Implementation

1259 Without relying upon any authentication information, the per-message signatures provide the necessary 1260 integrity qualities to counter the threats described in Section 5.1.1.

1261 To implement the countermeasures described in section 5.1.2.1 some mutually agreed upon form of 1262 authentication claims must be provided by the RM Source to the RM Destination during the establishment 1263 of the Security Context. These claims can then be used to determine if the RM Source is authorized to 1264 create a Sequence with the RM Destination.

This specification advocates implementing the countermeasures described in section 5.1.3.2 by requiring an RM node's Sequence peer to be equivalent to their security context session peer. This allows the authorization decisions described in section 5.1.3.2 to be based on the identity of the message's security context rather than on any authentication claims that may have been established during security context initiation. Note that other methods of using WS-SecureConversation to implement the countermeasures (such as associating specific authentication claims to a Sequence) are possible but not covered by this document.

As with transport security, the requisite equivalence of a security context peer and with a Sequence peer limits the lifetime of a Sequence to the lifetime of the protecting security context. Unlike transport security,

- 1274 the association between a Sequence and its protecting security context cannot always be established
- 1275 implicitly at Sequence creation time. This is due to the fact that the CreateSequence and
- 1276 CreateSequenceResponse messages may be signed by more than one security context.
- 1277 Issues specific to the life-cycle management of WS-SecureConversation security contexts (such as
- amending or renewing contexts) are outside the scope of this specification.

1279 6 Securing Sequences

As noted in Section 5, the RM Source and RM Destination should be able to protect their shared
 Sequences against the threat of Sequence Spoofing attacks. There are a number of OPTIONAL means of
 achieving this objective depending upon the underlying security infrastructure.

1283 6.1 Securing Sequences Using WS-Security

1284 One mechanism for protecting a Sequence is to include a security token using a

1285 wsse:SecurityTokenReference element from WS-Security (see section 9 in WS-

1286 SecureConversation) in the CreateSequence element. This establishes an association between the

1287 created (and, if present, offered) Sequence(s) and the referenced security token, such that the RM Source

and Destination MUST use the security token as the basis for authorization of all subsequent interactions

1289 related to the Sequence(s). The wsse: SecurityTokenReference explicitly identifies the token as

- 1290 there may be more than one token on a CreateSequence message or inferred from the communication
- 1291 context (e.g. transport protection).

1292 It is RECOMMENDED that a message independent referencing mechanism be used to identify the token, 1293 if the token being referenced supports such mechanism.

1294 The following exemplar defines the CreateSequence syntax when extended to include a

1295 wsse:SecurityTokenReference:

1296	<wsrm:createsequence></wsrm:createsequence>
1297	<wsrm:acksto></wsrm:acksto>
1298	<pre><wsrm:expires> xs:duration </wsrm:expires> ?</pre>
1299	<wsrm:offer></wsrm:offer>
1300	<wsrm:identifier> xs:anyURI </wsrm:identifier>
1301	<wsrm:endpoint> wsa:EndpointReferenceType </wsrm:endpoint>
1302	<pre><wsrm:expires> xs:duration </wsrm:expires> ?</pre>
1303	<wsrm:incompletesequencebehavior></wsrm:incompletesequencebehavior>
1304	wsrm:IncompleteSequenceBehaviorType
1305	?
1306	
1307	?
1308	
1309	<wsse:securitytokenreference></wsse:securitytokenreference>
1310	
1311	?
1312	
1313	

1314 The following describes the content model of the additional CreateSequence elements.

1315 /wsrm:CreateSequence/wsse:SecurityTokenReference

1316 This element uses the extensibility mechanism defined for the CreateSequence element (defined in

- 1317 section 3.4) to communicate an explicit reference to the security token, using a
- 1318 wsse:SecurityTokenReference as documented in WS-Security, that the RM Source and Destination
- 1319 MUST use to authorize messages for the created (and, if present, the offered) Sequence(s). All
- 1320 subsequent messages related to the created (and, if present, the offered) Sequence(s) MUST
- demonstrate proof-of-possession of the secret associated with the token (e.g., by using or deriving from a private or secret key).
- 1323 When a RM Source transmits a CreateSequence that has been extended to include a
- 1324 wsse:SecurityTokenReference it SHOULD ensure that the RM Destination both understands and
- 1325 will conform to the requirements listed above. In order to achieve this, the RM Source SHOULD include

the UsesSequenceSTR element as a SOAP header block within the CreateSequence message. This
element MUST include a soap:mustUnderstand attribute with a value of 'true'. Thus the RM Source
can be assured that a RM Destination that responds with a CreateSequenceResponse understands

1320 and conforms with the requirements listed shows. Note that an DM Destination understanding this hander

and conforms with the requirements listed above. Note that an RM Destination understanding this header
 does not mean that it has processed and understood any WS-Security headers, the fault behavior defined

1331 in WS-Security still applies.

1332 The following exemplar defines the UsesSequenceSTR syntax:

1333 <wsrm:UsesSequenceSTR ... />

1334 The following describes the content model of the <code>UsesSequenceSTR</code> header block.

1335 /wsrm:UsesSequenceSTR

1336 This element SHOULD be included as a SOAP header block in CreateSequence messages that use the

1337 extensibility mechanism described above in this section. The soap:mustUnderstand attribute value

1338 MUST be 'true'. The receiving RM Destination MUST understand and correctly implement the extension

1339 described above or else generate a soap:MustUnderstand fault, thus aborting the requested

1340 Sequence creation.

1341 The following is an example of a CreateSequence message using the

1342 wsse:SecurityTokenReference extension and the UsesSequenceSTR header block:

1343	<soap:envelope></soap:envelope>
1344	<soap:header></soap:header>
1345	
1346	<wsrm:usessequencestr soap:mustunderstand="true"></wsrm:usessequencestr>
1347	
1348	
1349	<soap:body></soap:body>
1350	<wsrm:createsequence></wsrm:createsequence>
1351	<wsrm:acksto></wsrm:acksto>
1352	<wsa:address>http://Business456.com/serviceA/789</wsa:address>
1353	
1354	<pre><wsse:securitytokenreference></wsse:securitytokenreference></pre>
1355	
1356	
1357	
1358	
1359	

1360 6.2 Securing Sequences Using SSL/TLS

One mechanism for protecting a Sequence is to bind the Sequence to the underlying SSL/TLS session(s).
The RM Source indicates to the RM Destination that a Sequence is to be bound to the underlying
SSL/TLS session(s) via the UsesSequenceSSL header block. If the RM Source wishes to bind a
Sequence to the underlying SSL/TLS sessions(s) it MUST include the UsesSequenceSSL element as a
SOAP header block within the CreateSequence message.

1366 The following exemplar defines the UsesSequenceSSL syntax:

(WSIM: 03e35equence55h Soap: Musconderstand- crue //	1367	<wsrm:usessequencessl< th=""><th><pre>soap:mustUnderstand="true"</pre></th><th></th><th>/></th></wsrm:usessequencessl<>	<pre>soap:mustUnderstand="true"</pre>		/>
--	------	--	---------------------------------------	--	----

1368 The following describes the content model of the UsesSequenceSSL header block.

1369 /wsrm:UsesSequenceSSL

- 1370 The RM Source MAY include this element as a SOAP header block of a CreateSequence message to
- 1371 indicate to the RM Destination that the resulting Sequence is to be bound to the SSL/TLS session that was

- 1372 used to carry the CreateSequence message. If included, the RM Source MUST mark this header with a
- $\texttt{1373} \quad \texttt{soap:mustUnderstand} \ \textbf{attribute with a value of `true'. The receiving RM \ Destination \ \textbf{MUST} \ understand$
- 1374 and correctly implement the functionality described in Section 5.2.1 or else generate a
- 1375 soap:MustUnderstand fault, thus aborting the requested Sequence creation.
- 1376 Note that the use inclusion of the above header by the RM Source implies that all Sequence-related
- 1377 information (Sequence Lifecycle or Acknowledgment messages or Sequence-related faults) flowing from
- 1378 the RM Destination to the RM Source will be bound to the SSL/TLS session that is used to carry the
- 1379 CreateSequenceResponse message.

1779 Appendix B. WSDL

This WSDL describes the WS-RM protocol from the point of view of an RM Destination. In the case where
an endpoint acts both as an RM Destination and an RM Source, note that additional messages may be
present in exchanges with that endpoint.

Also note that this WSDL is intended to describe the internal structure of the WS-RM protocol, and will not
 generally appear in a description of a WS-RM-capable Web service. See WS-RM Policy [WS-RM Policy]
 for a higher-level mechanism to indicate that WS-RM is engaged.

1786 The normative WSDL 1.1 definition for WS-ReliableMessaging is located at:

1787 http://docs.oasis-open.org/ws-rx/wsrm/200608/wsdl/wsrm-1.1-wsdl-200608.wsdl

1788 The following non-normative copy is provided for reference.

1789	xml version="1.0" encoding="utf-8"?
1790	</td
1791	OASIS takes no position regarding the validity or scope of any intellectual
1792	property or other rights that might be claimed to pertain to the
1793	implementation or use of the technology described in this document or the
1794	extent to which any license under such rights might or might not be available;
1795	neither does it represent that it has made any effort to identify any such
1796	rights. Information on OASIS's procedures with respect to rights in OASIS
1797	specifications can be found at the OASIS website. Copies of claims of rights
1798	made available for publication and any assurances of licenses to be made
1799	available, or the result of an attempt made to obtain a general license or
1800	permission for the use of such proprietary rights by implementors or users of
1801	this specification, can be obtained from the OASIS Executive Director.
1802	OASIS invites any interested party to bring to its attention any copyrights,
1803	patents or patent applications, or other proprietary rights which may cover
1804	technology that may be required to implement this specification. Please
1805	address the information to the OASIS Executive Director.

1939 Appendix C.2 Initial Transmission

1940 The following example WS-ReliableMessaging headers illustrate the message exchange in the above

1941 figure. The three messages have the following headers; the third message is identified as the last

1942 message in the Sequence:

1943 Message 1

1944	xml version="1.0" encoding="UTF-8"?

2143 Appendix C.6 MakeConnection

To illustrate how a MakeConnection message exchange can be used to deliver messages to an Endpoint that is not addressable, consider the case of a pub/sub scenario in which the Endpoint to which notifications are to be delivered (the "event consumer") is not addressable by the notification sending Endpoint (the "event producer"). In this scenario the event consumer must initiate the connections in order for the notifications to be delivered. One possible set of message exchanges (using HTTP) that demonstrate how this can be achieved using MakeConnection is shown below.

Step 1 – During a "subscribe" operation, the event consumer's EPR specifies the RM anonymous URI
 and the WS-RM Policy Assertion to indicate whether or not RM is required:

2152	<s:envelope <="" th="" xmlns:s="http://www.w3.org/2003/05/soap-envelope"></s:envelope>
2153	xmlns:wsrm="http://docs.oasis-open.org/ws-rx/wsrm/200608"
2154	<pre>xmlns:wsrmp="http://docs.oasis-open.org/ws-rx/wsrmp/200608"</pre>
2155	<pre>xmlns:wsa="http://www.w3.org/2005/08/addressing"></pre>
2156	<s:header></s:header>
2157	<wsa:to> http://example.org/subscriptionService </wsa:to>
2158	<pre><wsa:messageid> http://client456.org/id-a6d8-a7c2eb546813</wsa:messageid></pre>
2159	<wsa:replyto></wsa:replyto>
2160	<wsa:to> http://client456.org/response </wsa:to>
2161	
2162	
2163	<s:body></s:body>
2164	<sub:subscribe xmlns:sub="http://exaaple.org/subscriptionService"></sub:subscribe>
2165	<pre><!-- subscription service specific data--></pre>
2166	<targetepr></targetepr>

2167	<wsa:address>http://docs.oasis-open.org/ws-</wsa:address>
2168	rx/wsrm/200608/anonymous?id=550e8400-e29b-11d4-a716-446655440000
2169	<wsa:metadata></wsa:metadata>
2170	<wsp:policy wsu:id="MyPolicy"></wsp:policy>
2171	<wsrmp:rmassertion></wsrmp:rmassertion>
2172	
2173	
2174	
2175	
2176	
2177	

In this example the subscribe and targetEPR elements are simply examples of what a subscription
request message might contain. Note: the wsa:Address element contains the RM anonymous URI
indicating that the notification producer needs to queue the messages until they are requested using the
MakeConnection message exchange. The EPR also contains the WS-RM Policy Assertion indicating
the RM must be used when notifications related to this subscription are sent.

2183 Step 2 – Once the subscription is established, the event consumer checks for a pending message:

2184	<s:envelope <="" td="" xmlns:s="http://www.w3.org/2003/05/soap-envelope"></s:envelope>
2185	xmlns:wsrm="http://docs.oasis-open.org/ws-rx/wsrm/200608"
2186	<pre>xmlns:wsa="http://www.w3.org/2005/08/addressing"></pre>
2187	<s:header></s:header>
2188	<pre><wsa:action>http://docs.oasis-open.org/ws-</wsa:action></pre>
2189	rx/wsrm/200608/MakeConnection
2190	<pre><wsa:to> http://example.org/subscriptionService </wsa:to></pre>
2191	
2192	<s:body></s:body>
2193	<pre><wsrm:makeconnection></wsrm:makeconnection></pre>
2194	<pre><wsrm:address>http://docs.oasis-open.org/ws-</wsrm:address></pre>
2195	rx/wsrm/200608/anonymous?id=550e8400-e29b-11d4-a716-
2196	446655440000
2197	
2198	
2199	

Step 3 – If there are messages waiting to be delivered then a message will be returned back to the event
 consumer. However, because WS-RM is being used to deliver the messages, the first message returned
 is a CreateSequence:

2203	<s:envelope <="" td="" xmlns:s="http://www.w3.org/2003/05/soap-envelope"></s:envelope>
2204	xmlns:wsrm="http://docs.oasis-open.org/ws-rx/wsrm/200608"
2205	<pre>xmlns:wsa="http://www.w3.org/2005/08/addressing"></pre>
2206	<s:header></s:header>
2207	<wsa:action>http://docs.oasis-open-org/ws-</wsa:action>
2208	rx/wsrm/200608/CreateSequence
2209	<wsa:to>http://docs.oasis-open.org/ws-</wsa:to>
2210	rx/wsrm/200608/anonymous?id=550e8400-e29b-11d4-a716-446655440000
2211	<wsa:replyto> http://example.org/subscriptionService </wsa:replyto>
2212	<wsa:messageid> http://example.org/id-123-456 </wsa:messageid>
2213	
2214	<s:body></s:body>
2215	<wsrm:createsequence></wsrm:createsequence>
2216	<wsrm:acksto></wsrm:acksto>
2217	<pre><wsa:address> http://example.org/subscriptionService </wsa:address></pre>
2218	
2219	
2220	

2221 </S:Envelope>

2222 Notice from the perspective of how the RM Source on the event producer interacts with the RM

2223 Destination of those messages, nothing new is introduced by the use of the MakeConnection, the use

2224 of RM protocol is the same as the case where the event consumer is addressable.

2225 **Step 4** – The event consumer will respond with a CreateSequenceResponse message per normal WS-2226 Addressing rules:

2227	<s:envelope <="" th="" xmlns:s="http://www.w3.org/2003/05/soap-envelope"></s:envelope>
2228	xmlns:wsrm="http://docs.oasis-open.org/ws-rx/wsrm/200608"
2229	<pre>xmlns:wsa="http://www.w3.org/2005/08/addressing"></pre>
2230	<s:header></s:header>
2231	<wsa:action>http://docs.oasis-open-org/ws-</wsa:action>
2232	rx/wsrm/200608/CreateSequenceResponse
2233	<wsa:to> http://example.org/subscriptionService </wsa:to>
2234	<wsa:relatesto> http://example.org/id-123-456 </wsa:relatesto>
2235	
2236	<s:body></s:body>
2237	<wsrm:createsequenceresponse></wsrm:createsequenceresponse>
2238	<wsrm:identifier> http://example.org/rmid-456 </wsrm:identifier>
2239	
2240	
2241	

Note, this message is carried on an HTTP request directed to the wsa:ReplyTo EPR, and the HTTP response will be an HTTP 202.

2244 Step 5 – The event consumer checks for another message pending:

2245	<s:envelope <="" td="" xmlns:s="http://www.w3.org/2003/05/soap-envelope"></s:envelope>
2246	<pre>xmlns:wsrm="http://docs.oasis-open.org/ws-rx/wsrm/200608"</pre>
2247	<pre>xmlns:wsa="http://www.w3.org/2005/08/addressing"></pre>
2248	<s:header></s:header>
2249	<wsa:action>http://docs.oasis-open.org/ws-</wsa:action>
2250	rx/wsrm/200608/MakeConnection
2251	<wsa:to> http://example.org/subscriptionService </wsa:to>
2252	
2253	<s:body></s:body>
2254	<wsrm:makeconnection></wsrm:makeconnection>
2255	<wsrm:address>http://docs.oasis-open.org/ws-</wsrm:address>
2256	rx/wsrm/200608/anonymous?id=550e8400-e29b-11d4-a716-
2257	446655440000
2258	
2259	
2260	

2261 Notice this is the same message as the one sent in step 2.

2262 **Step 6** – If there is a message pending for this destination then it is returned on the HTTP response:

2263	<s:envelope <="" th="" xmlns:s="http://www.w3.org/2003/05/soap-envelope"></s:envelope>
2264	xmlns:wsrm="http://docs.oasis-open.org/ws-rx/wsrm/200608"
2265	xmlns:wsa="http://www.w3.org/2005/08/addressing">
2266	<s:header></s:header>
2267	<pre><wsa:action> http://example.org/eventType1 </wsa:action></pre>
2268	<wsa:to>http://docs.oasis-open.org/ws-</wsa:to>
2269	rx/wsrm/200608/anonymous?id=550e8400-e29b-11d4-a716-446655440000

```
2270
              <wsrm:Sequence>
2271
                <wsrm:Identifier> http://example.org/rmid-456 </wsrm:Identifier>
2272
             </wsrm:Sequence>
2273
              <wsrm:MessagePending pending="true"/>
2274
           </S:Header>
2275
           <S:Body>
             <!-- event specific data -->
2276
2277
           </S:Bodv>
2278
         </S:Envelope>
```

As noted in step 3, the use of the RM protocol does not change when using MakeConnection. The format of the messages, the order of the messages sent and the timing of when to send it remains the same.

Step 7 – At some later interval, or immediately due to the MessagePending header's "pending"
 attribute being set to "true", the event consumer will poll again:

```
2284
         <S:Envelope xmlns:S="http://www.w3.org/2003/05/soap-envelope"
2285
         xmlns:wsrm="http://docs.oasis-open.org/ws-rx/wsrm/200608"
2286
         xmlns:wsa="http://www.w3.org/2005/08/addressing">
2287
           <S:Header>
2288
             <wsa:Action>http://docs.oasis-open.org/ws-
2289
         rx/wsrm/200608/MakeConnection</wsa:Action>
2290
             <wsa:To> http://example.org/subscriptionService </wsa:To>
2291
           </S:Header>
2292
           <S:Body>
2293
             <wsrm:MakeConnection>
2294
               <wsrm:Address>http://docs.oasis-open.org/ws-
2295
         rx/wsrm/200608/anonymous?id=550e8400-e29b-11d4-a716-
2296
         446655440000</wsrm:Address>
2297
             </wsrm:MakeConnection>
2298
           </S:Body>
2299
         </S:Envelope>
```

Notice this is the same message as the one sent in steps 2 and 5. As in steps 3 and 6, the response to
the MakeConnection can be any message destined to the specified Endpoint. This allows the event
producer to send not only application messages but RM protocol messages (e.g. CloseSequence,
TerminateSequence or even additional CreateSequences) as needed.

Step 8 – If at any point in time there are no messages pending, in response to a MakeConnection the
 event producer returns an HTTP 202 back to the event consumer. The process then repeats (back to step
 7) until the subscription ends.

2307 Appendix D. State Tables

2308 This appendix specifies the non-normative state transition tables for RM Source and RM Destination.

2309 The state tables describe the lifetime of a sequence in both the RM Source and the RM Destination

2310 Legend:

2311 The first column of these tables contains the motivating event and has the following format:

Event
Event name [source] {ref}

2312 Where:

- Event Name: indicates the name of the event. Event Names surrounded by "<>" are optional as
 described by the specification.
- [source]: indicates the source of the event; one of:
- [msg] a Received message
- [int]: an internal event such as the firing of a timer
- [app]: the application
- 2319 [unspec]: the source is unspecified
- 2320 Each event / state combination cell in the tables in this appendix has the following format:

2321 Where:

- action to take: indicates that the state machine performs the following action. Actions surrounded
 by "<>" are optional as described by the specification. "Xmit" is used as a short form for the word
 "Transmit"
- [next state]: indicates the state to which the state machine will advance upon the performance of the action. For ease of reading the next state "same" indicates that the state does not change.
- {ref} is a reference to the document section describing the behavior in this cell

"N/A" in a cell indicates a state / event combination self-inconsistent with the state machine; should these
conditions occur, it would indicate an implementation error. A blank cell indicates that the behavior is not
described in this specification and does not indicate normal protocol operation. Implementations MAY
generate a Sequence Terminated fault (see section 4.2) in these circumstances. Robust implementations
MUST be able to operate in a stable manner despite the occurrence of unspecified event / state

2333 combinations.

2334 Table 1 RM Source Sequence State Transition Table

	Sequence States					
Events	None	Creating	Created	Closing	Closed	Terminating
Create Sequence [unspec] [3.4}	Xmit Create Sequence [Creating] {3.4}	N/A	N/A	N/A	N/A	N/A
Create Sequence Response [msg] (3.4)		Process Create Sequence Response [Created] {3.4}				
Create Sequence Refused Fault [msg] [3.4]		No action [None] {4.6}				
Send message [app] {2.1}	N/A	N/A	Xmit message [Same] {2}	No action [Same] {2}	N/A	N/A
Retransmit of un-ack'd message [int]	N/A	N/A	Xmit message [Same] {2.4}	Xmit message [Same] {2.4}	N/A	N/A
SeqAck (non- final) [msg] [3.9}	Generate Unknown Sequence Fault [Same]	Generate Unknown Sequence Fault [Same]	Process Ack ranges [Same]	Process Ack ranges [Same]	Process Ack ranges [Same]	Process Ack ranges [Same]
Nack [msg] (3.9)	{4.3} Generate Unknown Sequence Fault [Same] {4.3}	{4.3} Generate Unknown Sequence Fault [Same] {4.3}	{3.9} <xmit message(s)> [Same] {3.9}</xmit 	{3.9} <xmit message(s)> [Same] {3.9}</xmit 	{3.9} No action [Same]	{3.9} No action [Same]

<close Sequence> [int] (3.5}</close 	N/A		Xmit Close Sequence [Closing] {3.5}	N/A	N/A	N/A
Close Sequence Response [msg] [3.5]	Generate Unknown Sequence Fault [Same] {4.3}	Generate Unknown Sequence Fault [Same] {4.3}		No action [Closed] {3.5}	No action [Same] {3.5}	No action [Same] {3.5}
SeqAck (final) msg] 3.9}	Generate Unknown Sequence Fault [Same] {4.3}	Generate Unknown Sequence Fault [Same] {4.3}	Process Ack ranges [Closed] {3.9}	Process Ack ranges [Closed] {3.9}	Process Ack ranges [Same]	Process Ack ranges [Same]
Sequence Closed Fault msg]	Generate Unknown Sequence Fault	Generate Unknown Sequence Fault	No action [Closed] {4.7}	No action [Closed] {4.7}	No action [Same]	No action [Same]

	Sequence States					
Events	None	Creating	Created	Closing	Closed	Terminating
{4.7}	[Same] {4.3}	[Same] {4.3}				
Unknown Sequence Fault [msg] {4.3}			Terminate Sequence [None] {4.3}	Terminate Sequence [None] {4.3}	Terminate Sequence [None] {4.3}	Terminate Sequence [None] {4.3}
Sequence Terminated Fault [msg] {4.2}	N/A		Terminate Sequence [None] {4.2}	Terminate Sequence [None] {4.2}	Terminate Sequence [None] {4.2}	Terminate Sequence [None] {4.2}
Terminate Sequence [int]	N/A	No action [None] {unspec}	Xmit Terminate Sequence [Terminating]	Xmit Terminate Sequence [Terminating]	Xmit Terminate Sequence [Terminating]	N/A
Terminate Sequence Response [msg]	Generate Unknown Sequence Fault [Same] {4.3}	Generate Unknown Sequence Fault [Same] {4.3}				Terminate Sequence [None] {3.6}
Expires exceeded [int]	N/A	Terminate Sequence [None] {3.7}	Terminate Sequence [None] {3.7}	Terminate Sequence [None] {3.7}	Terminate Sequence [None] {3.7}	Terminate Sequence [None] {3.7}
Invalid Acknowledge ment [msg] {4.4]	Generate Unknown Sequence Fault [Same] {4.3}	Generate Unknown Sequence Fault [Same] {4.3}	Generate Invalid Acknowledgemen t Fault [Same] {4.4}	Generate Invalid Acknowledgemen t Fault [Same] {4.4}	Generate Invalid Acknowledgemen t Fault [Same] {4.4}	Generate Invalid Acknowledgement Fault [Same] {4.4}

2335 Table 2 RM Destination Sequence State Transition Table

Frencha	Sequence States				
Events	None	Created	Closed		
CreateSequence (successful) [msg/int] {3.4}	Xmit Create Sequence Response [Created] {3.4}	N/A	N/A		
CreateSequence (unsuccessful) [msg/int] {3.4}	Generate Create Sequence Refused Fault [None] {3.4}	N/A	N/A		
Message (with message number within range) [msg]	Generate Unknown Sequence Fault [Same] {4.3}	Accept Message; <xmit seqack=""> [Same]</xmit>	Generate Sequence Closed Fault (with SeqAck+Final) [Same] {3.5}		
Message (with message number outside of range) [msg]	Generate Unknown Sequence Fault [Same] {4.3}	Xmit Message Number Rollover Fault [Same] {3.7}{4.5}	Generate Sequence Closed Fault (with SeqAck+Final) [Same] {3.5}		
<ackrequested> [msg] {3.8}</ackrequested>	Generate Unknown Seq Fault [Same] {4.3}	Xmit SeqAck [Same] {3.8}	Xmit SeqAck+Final [Same] {3.9}		

Evente	Sequence States					
Events	None	Created	Closed			
CloseSequence [msg] {3.5}	Generate Unknown Sequence Fault [Same] {4.3}	Xmit CloseSequence Response with SeqAck+Final [Closed] {3.5}	Xmit CloseSequence Response with SeqAck+Final [Closed] {3.5}			
<closesequence autonomously> [int]</closesequence 	N/A	No Action [Closed]	N/A			
TerminateSequence [msg] {3.6)	Generate Unknown Sequence Fault [Same] {4.3}	Xmit Terminate Sequence Response [None] {3.6}	Xmit Terminate Sequence Response [None] {3.6}			
UnknownSequence Fault [msg] {4.3}		Terminate Sequence [None] {4.3}	Terminate Sequence [None] {4.3}			
SequenceTerminated Fault [msg] {4.2}		Terminate Sequence [None] {4.2}	Terminate Sequence [None] {4.2}			
Invalid Acknowledgement Fault	N/A					
[msg] {4.4}						
Expires exceeded [int]	N/A	Terminate Sequence [None] {3.4}	Terminate Sequence [None] {3.4}			
<seq acknowledgement<br="">autonomously> [int] {3.9}</seq>	N/A	Xmit SeqAck [Same] {3.9}	Xmit SeqAck+Final [Same] {3.9}			
Non WSRM message when WSRM required [msg] {4.8}	Generate WSRMRequired Fault [Same] {4.8}	Generate WSRMRequired Fault [Same] {4.8}	Generate WSRMRequired Fault [Same] {4.8}			

2336 The following two tables apply only if the MakeConnection mechanism is utilized.

2337 Table 3 Sending Endpoint Message Transfer Engine

Event	None	Queued n=1	Queued, n>1
Message destined to anon Endpoint when channel unavailable [int] {3.10}	Queue message [Queued n=1]	Queue message [Queued n>1]	Queue message [Queued n>1]
MakeConnection [msg] {3.10}		[none]	Xmit message with MessagePending [if n=2 then (Queued n=1) else (Queued n>1)]

2338 Table 4 Receiving Endpoint Message Transfer Engine

Event	None	Polling
Expectation of unreceived message [int, unspecified]	No Action [Polling]	No Action [Same]
Polling trigger [int, unspecified]		Xmit MakeConnection [Polling] (3.10}

2339 Appendix E. Acknowledgments

This document is based on initial contribution to OASIS WS-RX Technical Committee by the following authors:

Ruslan Bilorusets(BEA), Don Box(Microsoft), Luis Felipe Cabrera(Microsoft), Doug Davis(IBM),
Donald Ferguson(IBM), Christopher Ferris-Editor(BM), Tom Freund(IBM), Mary Ann Hondo(IBM),
John Ibbotson(IBM), Lei Jin(BEA), Chris Kaler(Microsoft), David Langworthy-Editor(Microsoft),
Amelia Lewis(TIBCO Software), Rodney Limprecht(Microsoft), Steve Lucco(Microsoft), Don
Mullen(TIBCO Software), Anthony Nadalin(IBM), Mark Nottingham(BEA), David Orchard(BEA),
Jamie Roots(IBM), Shivajee Samdarshi(TIBCO Software), John Shewchuk(Microsoft), Tony
Storey(IBM).

2349 The following individuals have provided invaluable input into the initial contribution:

Keith Ballinger(Microsoft), Stefan Batres(Microsoft), Rebecca Bergersen(Iona), Allen
 Brown(Microsoft), Michael Conner(IBM), George Copeland(Microsoft), Francisco Curbera(IBM),
 Paul Fremantle(IBM), Steve Graham(IBM), Pat Helland(Microsoft), Rick Hill(Microsoft), Scott
 Hinkelman(IBM), Tim Holloway(IBM), Efim Hudis(Microsoft), David Ingham(Microsoft), Gopal

Kakivaya(Microsoft), Johannes Klein(Microsoft), Frank Leymann(IBM), Martin Nally(IBM), Peter
 Niblett(IBM), Jeffrey Schlimmer(Microsoft), James Snell(IBM), Keith Stobie(Microsoft), Satish

2356 Thatte(Microsoft), Stephen Todd(IBM), Sanjiva Weerawarana(IBM), Roger Wolter(Microsoft).

2357 The following individuals were members of the committee during the development of this specification:

Abbie Barbir(Nortel), Charlton Barreto(Adobe), Stefan Batres(Microsoft), Hamid Ben 2358 Malek(Fujitsu), Andreas Bjarlestam(Ericsson), Toufic Boubez(Layer 7), Doug Bunting(Sun), Lloyd 2359 Burch(Novell), Steve Carter(Novell), Martin Chapman(Oracle), Dave Chappell(Sonic), Paul 2360 Cotton(Microsoft), Glen Daniels(Sonic), Doug Davis(IBM), Blake Dournaee(Intel), Jacques 2361 Durand(Fujitsu), Colleen Evans(Microsoft), Christopher Ferris(IBM), Paul Fremantle(WSO2), 2362 2363 Robert Freund(Hitachi), Peter Furniss(Erebor), Marc Goodner(Microsoft), Alastair Green(Choreology), Mike Grogan(Sun), Ondrej Hrebicek(Microsoft), Kazunori Iwasa(Fujitsu), 2364 2365 Chamikara Jayalath(WSO2), Lei Jin(BEA), Ian Jones(BTplc), Anish Karmarkar(Oracle), Paul Knight(Nortel), Dan Leshchiner(Tibco), Mark Little(JBoss), Lily Liu(webMethods), Matt 2366 2367 Lovett(IBM), Ashok Malhotra(Oracle), Jonathan Marsh(Microsoft), Daniel Millwood(IBM), Jeff Mischkinsky(Oracle), Nilo Mitra(Ericsson), Peter Niblett(IBM), Duane Nickull(Adobe), Eisaku 2368 Nishiyama(Hitachi), Dave Orchard(BEA), Chouthri Palanisamy(NEC), Sanjay Patil(SAP), Gilbert 2369 Pilz(BEA), Martin Raepple(SAP), Eric Rajkovic(Oracle), Stefan Rossmanith(SAP), Tom 2370 Rutt(Fujitsu), Rich Salz(IBM), Shivajee Samdarshi(Tibco), Vladimir Videlov(SAP), Claus von 2371 Riegen(SAP), Pete Wenzel(Sun), Steve Winkler(SAP), Ümit Yalçinalp(SAP), Nobuyuki 2372 2373 Yamamoto(Hitachi).

2374 Appendix F. Revision History

Rev	Date	By Whom	What
wd-01	2005-07-07	Christopher Ferris	Initial version created based on submission by the authors.
ws-02	2005-07-21	Doug Davis	I011 (PT0S) added
wd-02	2005-08-16	Anish Karmarkar	Trivial editorial changes
ws-03	2005-09-15	Doug Davis	I019 and i028 (CloseSeq) added
wd-05	2005-09-26	Gilbert Pilz	i005 (Source resend of nacks messages when ack already received) added.
wd-05	2005-09-27	Doug Davis	i027 (InOrder delivery assurance spanning multiple sequences) added
wd-05	2005-09-27	Doug Davis	i020 (Semantics of "At most once" Delivery Assurance) added
wd-05	2005-09-27	Doug Davis	i034 (Fault while processing a piggy-backed RM header) added
wd-05	2005-09-27	Doug Davis	i033 (Processing model of NACKs) added
wd-05	2005-09-27	Doug Davis	i031 (AckRequested schema inconsistency) added
wd-05	2005-09-27	Doug Davis	i025 (SeqAck/None) added
wd-05	2005-09-27	Doug Davis	i029 (Remove dependency on WS-Security) added
wd-05	2005-09-27	Doug Davis	i039 (What does 'have a mU attribute' mean) added
wd-05	2005-09-27	Doug Davis	i040 (Change 'optiona'/'required' to 'OPTIONAL'/'REQUIRED') added
wd-05	2005-09-30	Anish Karmarkar	i017 (Change NS to http://docs.oasis- open.org/wsrm/200510/)
wd-05	2005-09-30	Anish Karmarkar	i045 (Include SecureConversation as a reference and move it to non-normative citation)
wd-05	2005-09-30	Anish Karmarkar	i046 (change the type of wsrm:FaultCode element)
wd-06	2005-11-02	Gilbert Pilz	Start wd-06 by changing title page from cd-01.
wd-06	2005-11-03	Gilbert Pilz	i047 (Reorder spec sections)
wd-07	2005-11-17	Gilbert Pilz	Start wd-07
wd-07	2005-11-28	Doug Davis	i071 – except for period in Appendix headings
wd-07	2005-11-28	Doug Davis	i10
wd-07	2005-11-28	Doug Davis	i030
wd-07	2005-11-28	Doug Davis	i037
wd-07	2005-11-28	Doug Davis	i038
wd-07	2005-11-28	Doug Davis	i041
wd-07	2005-11-28	Doug Davis	i043
wd-07	2005-11-28	Doug Davis	i044

Rev	Date	By Whom	What
wd-07	2005-11-28	Doug Davis	i048
wd-07	2005-11-28	Doug Davis	i051
wd-07	2005-11-28	Doug Davis	1053
wd-07	2005-11-28	Doug Davis	i059
wd-07	2005-11-28	Doug Davis	i062
wd-07	2005-11-28	Doug Davis	i063
wd-07	2005-11-28	Doug Davis	i065
wd-07	2005-11-28	Doug Davis	i067
wd-07	2005-11-28	Doug Davis	i068
wd-07	2005-11-28	Doug Davis	i069
wd-07	2005-11-28	Doug Davis	Fix bulleted list (#2) in section 2.3
wd-07	2005-11-29	Gilbert Pilz	i074 (Use of [tcShortName] in artifact locations namespaces, etc)
wd-07	2005-11-29	Gilbert Pilz	i071 – Fixed styles and formating for TOC. Fixed styles of the appendix headings.
wd-07	2005-11-30	Doug Davis	Removed dup definition of "Receive"
wd-07	2005-11-30	Gilbert Pilz	Fixed lost formatting from heading for Namespace section. Fixed style of text body elements to match OASIS example documents. Fixed tables to match OASIS example documents.
wd-07	2005-12-01	Gilbert Pilz	Updated fix for i074 to eliminate trailing '/'. Added corresponding text around action IRI composition.
wd-07	2005-12-01	Gilbert Pilz	Use non-fixed fields for date values on both title page and body footers.
wd-07	2005-12-01	Doug Davis	Alphabetize the glossary
wd-07	2005-12-02	Doug Davis	i064
wd-07	2005-12-02	Doug Davis	i066
wd-08	2005-12-15	Doug Davis	Add back in RM Source to glossary
wd-08	2005-12-15	Steve Winkler	Doug added Steve's editorial nits
wd-08	2005-12-21	Doug Davis	i050
wd-08	2005-12-21	Doug Davis	i081
wd-08	2005-12-21	Doug Davis	i080 – but i050 negates the need for any changes
wd-08	2005-12-21	Doug Davis	i079
wd-08	2005-12-21	Doug Davis	I076 – didn't add text about "replies" since the RMD to RMS sequence could be used for any message not just replies
wd-08	2005-12-21	Umit Yalcinalp	Action Su03: removed wsse from Table 1
wd-08	2005-12-21	Umit Yalcinalp	1057 per Sunnyvale F2F 2005, Cleaned up some formatting errors in contributors
wd-08	2005-12-27	Doug Davis	i060
wd-08	2005-12-27	Gilbert Pilz	Moved schema and WSDL files to their own artifacts. Converted source document to

Rev	Date	By Whom	What
			OpenDocument Text format. Changed line numbers to be a single style.
wd-08	2005-12-28	Anish Karmarkar	Included a section link to c:\temp\wsrm-1.1- schema-200510.xsd and to c:\temp\wsrm-1.1- wsdl-200510.wsdl
wd-08	2006-01-04	Gilbert Pilz	Fixed formatting for included sections.
wd-08	2006-01-05	Gilbert Pilz	Created links for unused references. Fixed exemplars for CloseSequence and CloseSequenceResponse.
wd-09	2006-01-11	Doug Davis	Minor tweaks to text/typos.
wd-10	2006-01-23	Doug Davis	Accept all changes from wd-09
			Make some minor editoral tweaks from Marc's comments.
wd-10	2006-02-14	Doug Davis	Issue 082 resolution
wd-10	2006-02-14	Doug Davis	Issue 083 resolution
wd-10	2006-02-14	Doug Davis	Issue 085 resolution
wd-10	2006-02-14	Doug Davis	Issues 086, 087 resolutions
			Defined MessageNumberType
wd-10	2006-02-15	Doug Davis	Issue 078 resolution
wd-10	2006-02-15	Doug Davis	Issue 094 resolution
wd-10	2006-02-15	Doug Davis	Issue 095 resolution
wd-10	2006-02-15	Gilbert Pilz	Issue 088 – added namespace URI link to namespace URI; added text explaining that this URI could be dereferenced to produce the RDDL doc; added non-normative reference to RDDL 2.0
wd-10	2006-02-17	Anish Karmarkar	Namespace changed to 200602 for both WSDL and XSD docs.
wd-10	2006-02-17	Anish Karmarkar	Issue i087 as it applies to WSRM spec.
wd-10	2006-02-17	Anish Karmarkar	Added titles and minor text for state table (issue i058).
wd-11	2006-02-22	Doug Davis	Accept all changes for new WD
			Minor typos fixed
wd-11	2006-02-23	Doug Davis	s/'close'/close/g – per Marc Goodner
			Added first ref to [URI] – per Marc G again
wd-11	2006-02-27	Doug Davis	Issue i061 applied
wd-11	2006-02-28	Doug Davis	Fixed typo around the use of "above" and "below"
wd-11	2006-03-01	Doug Davis	Minor typos found by Marc Goodner
wd-11	2006-03-02	Doug Davis	Minor typos found by Matt Lovett
wd-11	2006-03-08	Doug Davis	Issue 091 applied
wd-11	2006-03-08	Doug Davis	Issue 092 applied
wd-11	2006-03-08	Doug Davis	Issue 100 applied

Rev	Date	By Whom	What
wd-12	2006-03-20	Doug Davis	Added space in "SOAP1.x" – PaulCotton
wd-12	2006-04-11	Doug Davis	Issue 007 applied
wd-12	2006-04-11	Doug Davis	Issue 090 applied
wd-12	2006-04-11	Doug Davis	Issue 098 applied
wd-12	2006-04-11	Doug Davis	Issue 099 applied
wd-12	2006-04-11	Doug Davis	Issue 101 applied
wd-12	2006-04-11	Doug Davis	Issue 103 applied
wd-12	2006-04-11	Doug Davis	Issue 104 applied
wd-12	2006-04-11	Doug Davis	Issue 105 applied
wd-12	2006-04-11	Doug Davis	Issue 107 applied
wd-12	2006-04-11	Doug Davis	Issue 109 applied
wd-12	2006-04-11	Doug Davis	Issue 110 applied
wd-12	2006-04-12	Doug Davis	Used "generated" instead of "issue" or "send" when talking about faults.
wd-12	2006-04-24	Gilbert Pilz	Update references to WS-Addressing to the Proposed Recommendations; update WS-RM namespace to "200604".
wd-13	2006-05-08	Gilbert Pilz	i093 part 1; more work needed
wd-13	2006-05-10	Doug Davis	Issue 096 applied
wd-13	2006-05-26	Gilbert Pilz	i093 part 2; reflects decisions from 2006-05-25 meeting
wd-13	2006-05-28	Gilbert Pilz	Issue 106 applied
wd-13	2006-05-29	Gilbert Pilz	Issue 118 applied
wd-13	2006-05-29	Gilbert Pilz	Issue 120 applied
wd-13	2006-05-30	Gilbert Pilz	Issue 114 applied
wd-13	2006-05-30	Gilbert Pilz	Issue 116 applied
wd-14	2006-06-05	Gilbert Pilz	Accept all changes; bump WD number
wd-14	2006-06-07	Doug Davis	Applied lots of minor edits from Marc Goodner
wd-14	2006-06-07	Doug Davis	Change a couple of period/sp/sp to period/sp
wd-14	2006-06-07	Doug Davis	Added a space in "URI])of" – per Marc Goodner
wd-14	2006-06-07	Doug Davis	Issue 131 applied
wd-14	2006-06-07	Doug Davis	Issue 132 applied
wd-14	2006-06-07	Doug Davis	Issue 119 applied
wd-14	2006-06-07	Doug Davis	Applied lots of minor edits from Doug Davis
wd-14	2006-06-07	Doug Davis	s/"none"/"full-uri"/ - per Marc Goodner
wd-14	2006-06-12	Doug Davis	Complete i106
wd-14	2006-06-12	Doug Davis	Issues 089 applied
wd-14	2006-06-12	Doug Davis	Fix for several RFC2119 keywords – per Anish

wd-15	2006-06-16	Doug Davis	Issue 127 applied
wd-15	2006-06-16	Doug Davis	Issue 133 applied
wd-15	2006-06-16	Doug Davis	Issue 136 applied
wd-15	2006-06-16	Doug Davis	Issue 138 applied
wd-15	2006-06-16	Doug Davis	Issue 135 applied
wd-15	2006-06-20	Doug Davis	Added all TC members to the ack list
wd-15	2006-06-22	Doug Davis	Issue 129 applied
wd-15	2006-06-22	Doug Davis	Issue 130 applied
wd-15	2006-06-22	Doug Davis	Issue 137 applied
wd-15	2006-06-26	Doug Davis	Issue 111 applied
wd-15	2006-06-26	Doug Davis	Missed a part of issue 129
wd-15	2006-06-30	Doug Davis	Fixed a typo in schema
wd-15	2006-06-30	Doug Davis	Issue 141 applied
wd-15	2006-06-30	Doug Davis	Issue 142 applied
wd-15	2006-06-30	Doug Davis	Issue 148 applied
wd-15	2006-06-30	Doug Davis	Issue 149 applied
wd-15	2006-06-30	Doug Davis	Issue 150 applied
wd-15	2006-07-06	Doug Davis	Issue 121 applied
wd-15	2006-07-21	Doug Davis	Issue 139 applied
wd-15	2006-07-21	Doug Davis	Issue 144 applied
wd-15	2006-07-21	Doug Davis	Issue 147 applied
wd-15	2006-07-21	Doug Davis	Issues 122-124 applied
wd-15	2006-07-27	Doug Davis	Updated list of oasis TC members (i134)
wd-15	2006-07-27	Doug Davis	Issue 140 applied
wd-15	2006-07-27	Doug Davis	Issue 145 applied
wd-15	2006-07-27	Doug Davis	Issue 143 applied
wd-15	2006-07-28	Doug Davis	Lots of minor typos found by Matt L.
wd-15	2006-07-28	Doug Davis	Issue 113 applied
wd-15	2006-08-04	Doug Davis	Update old namespaces – found by PaulC
wd-15	2006-08-04	Doug Davis	Issue 150 applied
wd-15	2006-08-04	Doug Davis	Minor typos – found by PeterN
wd-15	2006-08-04	Doug Davis	Verify all [refs]
wd-15	2006-08-04	Doug Davis	Change namespace to 2006/08
wd-15	2006-08-04	Doug Davis	Issue 148 applied
wd-15	2006-08-07	Doug Davis	Add some new glossary terms – per GilP
cd-04	2006-08-10	Gilbert Pilz	Formatting changes for better HTML rendering

Rev	Date	By Whom	What
cd-04	2006-08-11	Doug Davis	Issue 158 applied
cd-04	2006-08-11	Doug Davis	Issue 153 applied
cd-04	2006-08-11	Doug Davis	Issue 156 applied
cd-04	2006-08-15	Gilbert Pilz	More formatting changes for better HTML rendering.
wd-16	2006-10-25	Doug Davis	Accept all changes, update to wd16
wd-16	2006-10-26	Doug Davis	PR002 applied
wd-16	2006-10-26	Doug Davis	PR003 applied
wd-16	2006-10-26	Doug Davis	PR004 applied
wd-16	2006-10-27	Doug Davis	PR005 applied
wd-16	2006-10-27	Doug Davis	PR006 applied
wd-16	2006-10-27	Doug Davis	PR024 applied
wd-16	2006-11-13	Doug Davis	PR010 applied
wd-16	2006-11-13	Doug Davis	PR011 applied (technically as part of PR004)
wd-16	2006-11-13	Doug Davis	PR016 applied
wd-16	2006-11-13	Doug Davis	PR032 applied
wd-16	2006-11-20	Doug Davis	PR025 applied
wd-16	2006-11-20	Doug Davis	PR023 applied
wd-16	2006-12-03	Doug Davis	PR036 applied
wd-16	2006-12-03	Doug Davis	PR017 applied
wd-16	2006-12-11	Doug Davis	PR012 applied
wd-16	2006-12-14	Doug Davis	PR033 applied – changed a 'return' to 'generate' when talking about a fault
wd-16	2007-01-04	Doug Davis	PR018 applied

2374 Appendix G. Notices

OASIS takes no position regarding the validity or scope of any intellectual property or other rights that 2375 might be claimed to pertain to the implementation or use of the technology described in this document or 2376 the extent to which any license under such rights might or might not be available; neither does it represent 2377 that it has made any effort to identify any such rights. Information on OASIS's procedures with respect to 2378 rights in OASIS specifications can be found at the OASIS website. Copies of claims of rights made 2379 available for publication and any assurances of licenses to be made available, or the result of an attempt 2380 made to obtain a general license or permission for the use of such proprietary rights by implementors or 2381 users of this specification, can be obtained from the OASIS Executive Director. 2382

OASIS invites any interested party to bring to its attention any copyrights, patents or patent applications, or
other proprietary rights which may cover technology that may be required to implement this specification.
Please address the information to the OASIS Executive Director.

2386 Copyright (C) OASIS Open (2006). All Rights Reserved.

This document and translations of it may be copied and furnished to others, and derivative works that 2387 comment on or otherwise explain it or assist in its implementation may be prepared, copied, published and 2388 distributed, in whole or in part, without restriction of any kind, provided that the above copyright notice and 2389 this paragraph are included on all such copies and derivative works. However, this document itself may 2390 not be modified in any way, such as by removing the copyright notice or references to OASIS, except as 2391 2392 needed for the purpose of developing OASIS specifications, in which case the procedures for copyrights defined in the OASIS Intellectual Property Rights document must be followed, or as required to translate it 2393 into languages other than English. 2394

The limited permissions granted above are perpetual and will not be revoked by OASIS or its successors or assigns.
