#### 16 Abstract:

This specification (WS-ReliableMessaging) describes a protocol that allows messages to be transferred reliably between nodes implementing this protocol in the presence of software component, system, or network failures. The protocol is described in this specification in a transport-independent manner allowing it to be implemented using different network technologies. To support interoperable Web services, a SOAP binding is defined within this specification.

The protocol defined in this specification depends upon other Web services specifications for the identification of service endpoint addresses and policies. How these are identified and retrieved are detailed within those specifications and are out of scope for this document.

By using the XML [XML], SOAP [SOAP 1.1], [SOAP 1.2] and WSDL [WSDL 1.1] extensibility model, SOAP-based and WSDL-based specifications are designed to be composed with each other to define a rich Web services environment. As such, WS-ReliableMessaging by itself does not define all the features required for a complete messaging solution. WS-ReliableMessaging is a building block that is used in conjunction with other specifications and application-specific protocols to accommodate a wide variety of requirements and scenarios related to the operation of distributed Web services.

#### 31 Status:

This document was last revised or approved by the WS-RX on the above date. The level of approval is also listed above. Check the current location noted above for possible later revisions of this document. This document is updated periodically on no particular schedule. Technical Committee members should send comments on this specification to the Technical Committee's email list. Others should send comments to the Technical Committee by using the "Send A Comment" button on the Technical Committee's web page at <a href="http://www.oasis-open.org/committees/ws-rx">http://www.oasis-open.org/committees/ws-rx</a>. For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (<a href="http://www.oasis-open.org/committees/ws-rx/ipr.php">http://www.oasis-open.org/committees/ws-rx/ipr.php</a>. The non-normative errata page for this specification is located at <a href="http://www.oasis-open.org/committees/ws-rx">http://www.oasis-open.org/committees/ws-rx</a>.

## <sub>05</sub> 1 Introduction

- 106 It is often a requirement for two Web services that wish to communicate to do so reliably in the presence
- of software component, system, or network failures. The primary goal of this specification is to create a
- modular mechanism for reliable transfer of messages. It defines a messaging protocol to identify, track,
- and manage the reliable transfer of messages between a source and a destination. It also defines a
- 110 SOAP binding that is required for interoperability. Additional bindings can be defined.
- 111 This mechanism is extensible allowing additional functionality, such as security, to be tightly integrated.
- 112 This specification integrates with and complements the WS-Security [WS-Security], WS-Policy [WS-
- Policy, and other Web services specifications. Combined, these allow for a broad range of reliable,
- 114 secure messaging options.

#### 115 1.1 Notational Conventions

- 116 The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD
- 117 NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described
- 118 in RFC 2119 [KEYWORDS].
- 119 This specification uses the following syntax to define normative outlines for messages:
- The syntax appears as an XML instance, but values in italics indicate data types instead of values.
  - Characters are appended to elements and attributes to indicate cardinality:
    - o "?" (0 or 1)
- o "\*" (0 or more)
- o "+" (1 or more)
- The character "|" is used to indicate a choice between alternatives.
- The characters "[" and "]" are used to indicate that contained items are to be treated as a group with respect to cardinality or choice.
  - An ellipsis (i.e. "...") indicates a point of extensibility that allows other child or attribute content specified in this document. Additional children elements and/or attributes MAY be added at the indicated extension points but they MUST NOT contradict the semantics of the parent and/or owner, respectively. If an extension is not recognized it SHOULD be ignored.
  - XML namespace prefixes (See Section 1.2) are used to indicate the namespace of the element being defined.
- 134 Elements and Attributes defined by this specification are referred to in the text of this document using
- 135 XPath 1.0 [XPATH 1.0] expressions. Extensibility points are referred to using an extended version of this
- 136 syntax:

121

122

128

129

130

131132

133

137

138

139

- An element extensibility point is referred to using {any} in place of the element name. This
  indicates that any element name can be used, from any namespace other than the wsrm:
  namespace.
- An attribute extensibility point is referred to using @{any} in place of the attribute name. This indicates that any attribute name can be used, from any namespace other than the wsrm: namespace.

## 3 1.2 Namespace

- 144 The XML namespace [XML-ns] URI that MUST be used by implementations of this specification is:
- http://docs.oasis-open.org/ws-rx/wsrm/200608
- 146 Dereferencing the above URI will produce the Resource Directory Description Language [RDDL 2.0]
- 147 document that describes this namespace.
- 148 Table 1 lists the XML namespaces that are used in this specification. The choice of any namespace prefix
- 149 is arbitrary and not semantically significant.
- 150 Table 1

Prefix	Namespace
S	(Either SOAP 1.1 or 1.2)
S11	http://schemas.xmlsoap.org/soap/envelope/
S12	http://www.w3.org/2003/05/soap-envelope
wsrm	http://docs.oasis-open.org/ws-rx/wsrm/200608
wsa	http://www.w3.org/2005/08/addressing
wsaw	http://www.w3.org/2006/05/addressing/wsdl
wsse	http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-secext-1.0.xsd
xs	http://www.w3.org/2001/XMLSchema

- 151 The normative schema for WS-ReliableMessaging can be found linked from the namespace document
- that is located at the namespace URI specified above.
- All sections explicitly noted as examples are informational and are not to be considered normative.

#### 54 1.3 Conformance

- An implementation is not conformant with this specification if it fails to satisfy one or more of the MUST or
- 156 REQUIRED level requirements defined herein. A SOAP Node MUST NOT use the XML namespace
- identifier for this specification (listed in Section 1.2) within SOAP Envelopes unless it is conformant with
- 158 this specification.
- Normative text within this specification takes precedence over normative outlines, which in turn take
- precedence over the XML Schema [XML Schema Part 1, Part 2] descriptions.

## 2 Reliable Messaging Model

Many errors can interrupt a conversation. Messages can be lost, duplicated or reordered. Further the host systems can experience failures and lose volatile state.

The WS-ReliableMessaging specification defines an interoperable protocol that enables a Reliable
Messaging (RM) Source to accurately determine the disposition of each message it Transmits as
perceived by the RM Destination, so as to allow it to resolve any in-doubt status regarding receipt of the
message Transmitted. The protocol also enables an RM Destination to efficiently determine which of
those messages it Receives have been previously Received, enabling it to filter out duplicate message
transmissions caused by the retransmission, by the RM Source, of an unacknowledged message. It also
enables an RM Destination to Deliver the messages it Receives to the Application Destination in the order
in which they were sent by an Application Source, in the event that they are Received out of order. Note
that this specification places no restriction on the scope of the RM Source or RM Destination entities. For
example, either can span multiple WSDL Ports or Endpoints.

The protocol enables the implementation of a broad range of reliability features which include ordered
Delivery, duplicate elimination, and guaranteed receipt. The protocol can also be implemented with a
range of robustness characteristics ranging from in-memory persistence that is scoped to a single process
lifetime, to replicated durable storage that is recoverable in all but the most extreme circumstances. It is
expected that the Endpoints will implement as many or as few of these reliability characteristics as
necessary for the correct operation of the application using the protocol. Regardless of which of the
reliability features is enabled, the wire protocol does not change.

Figure 1 below illustrates the entities and events in a simple reliable exchange of messages. First, the
Application Source Sends a message for reliable transfer. The Reliable Messaging Source accepts the
message and Transmits it one or more times. After accepting the message, the RM Destination
Acknowledges it. Finally, the RM Destination Delivers the message to the Application Destination. The
exact roles the entities play and the complete meaning of the events will be defined throughout this
specification.

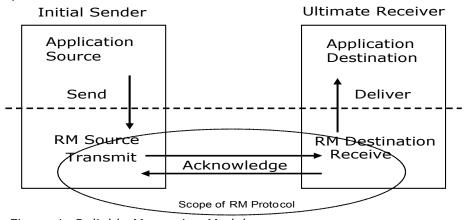

Figure 1: Reliable Messaging Model

## 2.1 Glossary

187

188

189 The following definitions are used throughout this specification:

Accept: The act of qualifying a message by the RM Destination such that it becomes eligible for Delivery and acknowledgement.

- 192 Acknowledgement: The communication from the RM Destination to the RM Source indicating the
- 193 successful receipt of a message.
- 194 Acknowledgement Message: A message containing a SequenceAcknowledgement header block.
- 195 Acknowledgement Messages may or may not contain a SOAP body.
- 196 Acknowledgement Request: A message containing an AckRequested header. Acknowledgement
- 197 Requests may or may not contain a SOAP body.
- 198 **Application Destination:** The Endpoint to which a message is Delivered.
- 199 **Application Source:** The Endpoint that Sends a message.
- 200 **Back-channel:** When the underlying transport provides a mechanism to return a transport-protocol
- 201 specific response, capable of carrying a SOAP message, without initiating a new connection, this
- 202 specification refers to this mechanism as a back-channel.
- 203 **Deliver:** The act of transferring a message from the RM Destination to the Application Destination.
- 204 Endpoint: As defined in the WS-Addressing specification [WS-Addressing]; a Web service Endpoint is a
- 205 (referenceable) entity, processor, or resource to which Web service messages can be addressed.
- 206 Endpoint references (EPRs) convey the information needed to address a Web service Endpoint.
- 207 Receive: The act of reading a message from a network connection and accepting it.
- 208 RM Destination: The Endpoint that Receives messages Transmitted reliably from an RM Source.
- 209 RM Protocol Header Block: One of Sequence, SequenceAcknowledgement, or AckRequested.
- 210 **RM Source:** The Endpoint that Transmits messages reliably to an RM Destination.
- 211 **Send:** The act of transferring a message from the Application Source to the RM Source for reliable
- 212 transfer.
- 213 Sequence Lifecycle Message: A message that contains one of: CreateSequence,
- 214 CreateSequenceResponse, CloseSequence, CloseSequenceResponse, TerminateSequence,
- 215 TerminateSequenceResponse as the child element of the SOAP body element.
- 216 Sequence Traffic Message: A message containing a Sequence header block.
- 217 **Transmit:** The act of writing a message to a network connection.

#### 218 2.2 Protocol Preconditions

- The correct operation of the protocol requires that a number of preconditions MUST be established prior to the processing of the initial sequenced message:
- For any single message exchange the RM Source MUST have an endpoint reference that uniquely identifies the RM Destination Endpoint.
- The RM Source MUST have successfully created a Sequence with the RM Destination.
- The RM Source MUST be capable of formulating messages that adhere to the RM Destination's policies.
- If a secure exchange of messages is REQUIRED, then the RM Source and RM Destination MUST have a security context.

#### 2.3 Protocol Invariants

230

231

232233

234 235

236 237

238

239

240

241

229 During the lifetime of a Sequence, the following invariants are REQUIRED for correctness:

- The RM Source MUST assign each message within a Sequence a message number (defined below) beginning at 1 and increasing by exactly 1 for each subsequent message. These numbers MUST be assigned in the same order in which messages are sent by the Application Source.
- Within every Acknowledgement Message it issues, the RM Destination MUST include one or more AcknowledgementRange child elements that contain, in their collective ranges, the message number of every message accepted by the RM Destination. The RM Destination MUST exclude, in the AcknowledgementRange elements, the message numbers of any messages it has not accepted. If no messages have been received the RM Destination MUST return None instead of an AcknowledgementRange(s). The RM Destination MAY transmit a Nack for a specific message or messages in stead of an AcknowledgementRange(s).
- While the Sequence is not closed or terminated, the RM Source SHOULD retransmit unacknowledged messages.

## 242 2.4 Example Message Exchange

243 Figure 2 illustrates a possible message exchange between two reliable messaging Endpoints A and B.

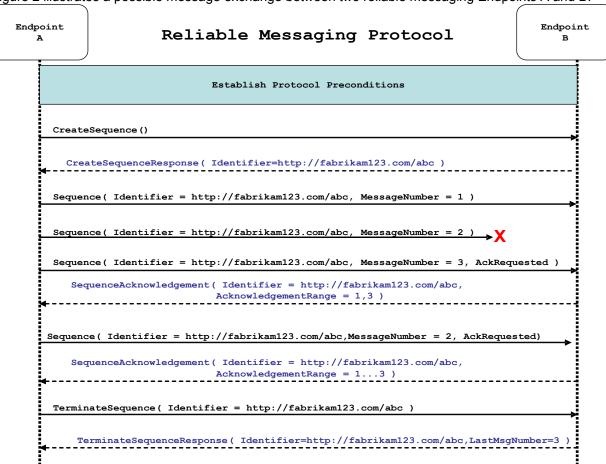

Figure 2: The WS-ReliableMessaging Protocol

- 1. The protocol preconditions are established. These include policy exchange, endpoint resolution, 244 and establishing trust. 245
- 2. The RM Source requests creation of a new Sequence. 246
- 3. The RM Destination creates a new Sequence and returns its unique identifier. 247
- 4. The RM Source begins Transmitting messages in the Sequence beginning with MessageNumber 1. 248 In the figure above, the RM Source sends 3 messages in the Sequence. 249
- 5. The 2<sup>nd</sup> message in the Sequence is lost in transit. 250
  - 6. The 3rd message is the last in this Sequence and the RM Source includes an AckRequested header to ensure that it gets a timely SequenceAcknowledgement for the Sequence.
- 7. The RM Destination acknowledges receipt of message numbers 1 and 3 as a result of receiving the 253 RM Source's AckRequested header. 254
  - 8. The RM Source retransmits the unacknowledged message with MessageNumber 2. This is a new message from the perspective of the underlying transport, but it has the same Sequence Identifier and MessageNumber so the RM Destination can recognize it as a duplicate of the earlier message, in case the original and retransmitted messages are both Received. The RM Source includes an AckRequested header in the retransmitted message so the RM Destination will expedite an acknowledgement.
  - 9. The RM Destination Receives the second transmission of the message with MessageNumber 2 and acknowledges receipt of message numbers 1, 2, and 3.
    - 10. The RM Source Receives this Acknowledgement and sends a Terminate Sequence message to the RM Destination indicating that the Sequence is completed. The TerminateSequence message indicates that message number 3 was the last message in the Sequence. The RM Destination then reclaims any resources associated with the Sequence.
    - 11. The RM Destination Receives the TerminateSequence message indicating that the RM Source will not be sending any more messages. The RM Destination sends a TerminateSequenceResponse message to the RM Source and reclaims any resources associated with the Sequence.
- The RM Source will expect to Receive Acknowledgements from the RM Destination during the course of a 270 message exchange at occasions described in Section 3 below. Should an Acknowledgement not be
- Received in a timely fashion, the RM Source MUST re-transmit the message since either the message or 272
- the associated Acknowledgement might have been lost. Since the nature and dynamic characteristics of
- the underlying transport and potential intermediaries are unknown in the general case, the timing of re-
- transmissions cannot be specified. Additionally, over-aggressive re-transmissions have been
- demonstrated to cause transport or intermediary flooding which are counterproductive to the intention of 276
- providing a reliable exchange of messages. Consequently, implementers are encouraged to utilize
- adaptive mechanisms that dynamically adjust re-transmission time and the back-off intervals that are
- appropriate to the nature of the transports and intermediaries envisioned. For the case of TCP/IP
- transports, a mechanism similar to that described as RTTM in RFC 1323 [RTTM] SHOULD be
- considered. 281

251

267

268

269

271

Now that the basic model has been outlined, the details of the elements used in this protocol are now 282 provided in Section 3.

## 284 3 RM Protocol Elements

287

305

306

307

308

309

310

The following sub-sections define the various RM protocol elements, and prescribe their usage by a conformant implementations.

## 3.1 Considerations on the Use of Extensibility Points

The following protocol elements define extensibility points at various places. Implementations MAY add child elements and/or attributes at the indicated extension points but MUST NOT contradict the semantics of the parent and/or owner, respectively. If a receiver does not recognize an extension, the receiver SHOULD ignore the extension.

## 292 3.2 Considerations on the Use of "Piggy-Backing"

Some RM Protocol Header Blocks may be added to messages that are targeted to the same Endpoint to which those headers are to be sent (a concept often referred to as "piggy-backing"), thus saving the overhead of an additional message exchange. Reference parameters MUST be considered when determining whether two EPRs are targeted to the same Endpoint. The determination of if and when a Header Block will be piggy-backed onto another message is made by the entity (RM Source or RM Destination) that is sending the header. In order to ensure optimal and successful processing of RM Sequences, endpoints that receive RM-related messages SHOULD be prepared to process RM Protocol Header Blocks that are included in any message it receives. See the sections that define each RM Protocol Header Block to know which ones may be considered for piggy-backing.

## 3.3 Composition with WS-Addressing

When the RM protocol, defined in this specification, is composed with the WS-Addressing specification, the following rules prescribe the constraints on the value of the wsa:Action header:

- 1. When an Endpoint generates a message that carries an RM protocol element, that is defined in the following sections, in the body of a SOAP envelope that Endpoint MUST include in that envelope a wsa:Action SOAP header block whose value is an IRI that is a concatenation of the WS-RM namespace URI, followed by a "/", followed by the value of the local name of the child element of the SOAP body. For example, for a Sequence creation request message as described in section 3.4 below, the value of the wsa:Action IRI would be:
- http://docs.oasis-open.org/ws-rx/wsrm/200608/CreateSequence
- 2. When an Endpoint generates an Acknowledgement Message that has no element content in the SOAP body, then the value of the wsa:Action IRI MUST be:
- http://docs.oasis-open.org/ws-rx/wsrm/200608/SequenceAcknowledgement
- 31. When an Endpoint generates an Acknowledgement Request that has no element content in the SOAP body, then the value of the wsa:Action IRI MUST be:
- 317 http://docs.oasis-open.org/ws-rx/wsrm/200608/AckRequested
- 4. When an Endpoint generates an RM fault as defined in section 4 below, the value of the wsa: Action IRI MUST be as defined in section 4 below.

## 320 3.4 Sequence Creation

- 321 The RM Source MUST request creation of an outbound Sequence by sending a CreateSequence
- 322 element in the body of a message to the RM Destination which in turn responds either with a message
- 323 containing CreateSequenceResponse or a CreateSequenceRefused fault. The RM Source MAY
- 324 include an offer to create an inbound Sequence within the CreateSequence message. This offer is
- 325 either accepted or rejected by the RM Destination in the CreateSequenceResponse message.
- 326 The SOAP version used for the CreateSequence message SHOULD be used for all subsequent
- 327 messages in or for that Sequence, sent by either the RM Source or the RM Destination.
- 328 The following exemplar defines the CreateSequence syntax:

```
329
        <wsrm:CreateSequence ...>
            <wsrm:AcksTo> wsa:EndpointReferenceType </wsrm:AcksTo>
330
            <wsrm:Expires ...> xs:duration </wsrm:Expires> ?
331
            <wsrm:Offer ...>
332
                <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
333
334
                <wsrm:Endpoint> wsa:EndpointReferenceType </wsrm:Endpoint>
335
                <wsrm:Expires ...> xs:duration </wsrm:Expires> ?
336
                <wsrm:IncompleteSequenceBehavior>
337
                     wsrm:IncompleteSequenceBehaviorType
338
                </wsrm:IncompleteSequenceBehavior> ?
339
340
            </wsrm:Offer> ?
341
342
        </wsrm:CreateSequence>
```

- 343 The following describes the content model of the CreateSequence element.
- 344 /wsrm:CreateSequence
- This element requests creation of a new Sequence between the RM Source that sends it, and the RM
- Destination to which it is sent. The RM Source MUST NOT send this element as a header block. The RM
- 347 Destination MUST respond either with a CreateSequenceResponse response message or a
- 348 CreateSequenceRefused fault.
- 349 /wsrm:CreateSequence/wsrm:AcksTo
- 350 The RM Source MUST include this element in any CreateSequence message it sends. This element is of
- 351 type wsa: EndpointReferenceType (as specified by WS-Addressing). It specifies the endpoint
- 352 reference to which messages containing SequenceAcknowledgement header blocks and faults related
- to the created Sequence are to be sent, unless otherwise noted in this specification (for example, see
- 354 Section 3.5).
- 355 Implementations MUST NOT use an endpoint reference in the AcksTo element that would prevent the
- 356 sending of Sequence Acknowledgements back to the RM Source. For example, using the WS-Addressing
- 357 "http://www.w3.org/2005/08/addressing/none" IRI would make it impossible for the RM Destination to ever
- 358 send Sequence Acknowledgements.
- 359 /wsrm:CreateSequence/wsrm:Expires
- 360 This element, if present, of type xs: duration specifies the RM Source's requested duration for the
- 361 Sequence. The RM Destination MAY either accept the requested duration or assign a lesser value of its
- 362 choosing. A value of "PT0S" indicates that the Sequence will never expire. Absence of the element
- 363 indicates an implied value of "PT0S".
- 364 /wsrm:CreateSequence/wsrm:Expires/@{any}

- This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 366 element.
- 367 /wsrm:CreateSequence/wsrm:Offer
- 368 This element, if present, enables an RM Source to offer a corresponding Sequence for the reliable
- exchange of messages Transmitted from RM Destination to RM Source.
- 370 /wsrm:CreateSequence/wsrm:Offer/wsrm:Identifier
- The RM Source MUST set the value of this element to an absolute URI (conformant with RFC3986 [URI])
- 372 that uniquely identifies the offered Sequence.
- 373 /wsrm:CreateSequence/wsrm:Offer/wsrm:Identifier/@{any}
- 374 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 375 element.
- 376 /wsrm:CreateSequence/wsrm:Offer/wsrm:Endpoint
- 377 An RM Source MUST include this element, of type wsa: EndpointReferenceType (as specified by
- 378 WS-Addressing). This element specifies the endpoint reference to which Sequence Lifecycle Messages,
- 379 Acknowledgement Requests, and fault messages related to the offered Sequence are to be sent.
- 380 Implementations MUST NOT use an endpoint reference in the Endpoint element that would prevent the
- 381 sending of Sequence Lifecycle Message, etc. For example, using the WS-Addressing
- 382 "http://www.w3.org/2005/08/addressing/none" IRI would make it impossible for the RM Destination to ever
- 383 send Sequence Lifecycle Messages (e.g. TerminateSequence) to the RM Source for the Offered
- 384 Sequence. Implementations MAY use the WS-MakeConnection anonymous URI template and doing so-
- 385 implies that messages will be retrieved using a mechanism such as the MakeConnection message.
- 386 The Offer of an Endpoint containing the "http://www.w3.org/2005/08/addressing/anonymous" IRI as its
- 387 address is problematic due to the inability of a source to connect to this address and retry
- 388 unacknowledged messages (as described in Section 2.3). When offering a Sequence with such an IRI, an
- 389 endpoint MUST ensure that it will provide the protocol back-channel opportunities necessary to carry
- 390 Sequence Traffic Messages for the offered Sequence, as well as any Sequence Lifecycle Messages
- 391 and/or Acknowledgement Requests that the anonymous RM Destination expects to receive for this
- 392 Sequence. In the absence of sufficient assurance that the endpoint offering the sequence will provide
- 393 these opportunities, an RM Destination MUST NOT accept (via the
- 394 /wsrm:CreateSequenceResponse/wsrm:Accept element described below) an Offer that contains the
- 395 "http://www.w3.org/2005/08/addressing/anonymous" IRI as its address.
- 396 /wsrm:CreateSequence/wsrm:Offer/wsrm:Expires
- 397 This element, if present, of type xs: duration specifies the duration for the offered Sequence. A value of
- 398 "PT0S" indicates that the offered Sequence will never expire. Absence of the element indicates an implied
- 399 value of "PT0S".
- 400 /wsrm:CreateSequence/wsrm:Offer/wsrm:Expires/@{any}
- 401 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 402 element.
- 403 /wsrm:CreateSequence/wsrm:Offer/wsrm:IncompleteSequenceBehavior
- This element, if present, specifies the behavior that the destination will exhibit upon the closure or
- 405 termination of an incomplete Sequence. For the purposes of defining the values used, the term "discard"
- 406 refers to behavior equivalent to the Application Destination never processing a particular message.

- 407 A value of "DiscardEntireSequence" indicates that the entire Sequence MUST be discarded if the
- 408 Seguence is closed, or terminated, when there are one or more gaps in the final
- 409 SequenceAcknowledgement.
- 410 A value of "DiscardFollowingFirstGap" indicates that messages in the Sequence beyond the first gap
- 411 MUST be discarded when there are one or more gaps in the final SequenceAcknowledgement.
- 410 The default value of "NoDiscard" indicates that no acknowledged messages in the Sequence will be
- 411 discarded.
- 410 /wsrm:CreateSequence/wsrm:Offer/{any}
- 410 This is an extensibility mechanism to allow different (extensible) types of information, based on a schema,
- 411 to be passed.
- 410 /wsrm:CreateSequence/wsrm:Offer/@{any}
- 410 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 411 element.
- 410 /wsrm:CreateSequence/{any}
- 410 This is an extensibility mechanism to allow different (extensible) types of information, based on a schema,
- 411 to be passed.
- 410 /wsrm:CreateSequence/@{any}
- 410 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 411 element.
- 410 A CreateSequenceResponse is sent in the body of a response message by an RM Destination in
- 411 response to receipt of a CreateSequence request message. It carries the Identifier of the created
- 412 Sequence and indicates that the RM Source can begin sending messages in the context of the identified
- 413 Sequence.
- 410 The following exemplar defines the CreateSequenceResponse syntax:

```
410
        <wsrm:CreateSequenceResponse ...>
410
            <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
410
            <wsrm:Expires ...> xs:duration </wsrm:Expires> ?
410
            <wsrm:IncompleteSequenceBehavior>
                wsrm:IncompleteSequenceBehaviorType
410
410
            </wsrm:IncompleteSequenceBehavior> ?
            <wsrm:Accept ...>
410
410
                <wsrm:AcksTo> wsa:EndpointReferenceType </wsrm:AcksTo>
410
                 . . .
410
            </wsrm:Accept> ?
410
        </wsrm:CreateSequenceResponse>
410
```

- 410 The following describes the content model of the CreateSequenceResponse element.
- 410 /wsrm:CreateSequenceResponse
- 410 This element is sent in the body of the response message in response to a CreateSequence request
- 411 message. It indicates that the RM Destination has created a new Sequence at the request of the RM
- 412 Source. The RM Destination MUST NOT send this element as a header block.
- 410 /wsrm:CreateSequenceResponse/wsrm:Identifier

- 410 The RM Destination MUST include this element within any CreateSequenceResponse message it sends.
- 411 The RM Destination MUST set the value of this element to the absolute URI (conformant with RFC3986)
- 412 that uniquely identifies the Seguence that has been created by the RM Destination.
- 410 /wsrm:CreateSequenceResponse/wsrm:Identifier/@{any}
- 410 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 411 element.
- 410 /wsrm:CreateSequenceResponse/wsrm:Expires
- 410 This element, if present, of type xs: duration accepts or refines the RM Source's requested duration for
- 411 the Sequence. It specifies the amount of time after which any resources associated with the Sequence
- 412 SHOULD be reclaimed thus causing the Sequence to be silently terminated. At the RM Destination this
- duration is measured from a point proximate to Sequence creation and at the RM Source this duration is
- 414 measured from a point approximate to the successful processing of the CreateSequenceResponse. A
- 415 value of "PT0S" indicates that the Sequence will never expire. Absence of the element indicates an
- 416 implied value of "PT0S". The RM Destination MUST set the value of this element to be equal to or less
- 417 than the value requested by the RM Source in the corresponding CreateSequence message.
- 410 /wsrm:CreateSequenceResponse/wsrm:Expires/@{any}
- 410 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 411 element.
- 410 /wsrm:CreateSequenceResponse/wsrm:IncompleteSequenceBehavior
- This element, if present, specifies the behavior that the destination will exhibit upon the closure or
- 411 termination of an incomplete Sequence. For the purposes of defining the values used, the term "discard"
- 412 refers to behavior equivalent to the Application Destination never processing a particular message.
- 410 A value of "DiscardEntireSequence" indicates that the entire Sequence MUST be discarded if the
- 411 Sequence is closed, or terminated, when there are one or more gaps in the final
- 412 SequenceAcknowledgement.
- 410 A value of "DiscardFollowingFirstGap" indicates that messages in the Sequence beyond the first gap
- 411 MUST be discarded when there are one or more gaps in the final SequenceAcknowledgement.
- 410 The default value of "NoDiscard" indicates that no acknowledged messages in the Sequence will be
- 411 discarded.
- 410 /wsrm:CreateSequenceResponse/wsrm:Accept
- 410 This element, if present, enables an RM Destination to accept the offer of a corresponding Sequence for
- 411 the reliable exchange of messages Transmitted from RM Destination to RM Source.
- 410 Note: If a CreateSequenceResponse is returned without a child Accept in response to a
- 411 CreateSequence that did contain a child Offer, then the RM Source MAY immediately reclaim any
- 412 resources associated with the unused offered Sequence.
- 410 /wsrm:CreateSequenceResponse/wsrm:Accept/wsrm:AcksTo
- 410 The RM Destination MUST include this element, of type wsa: EndpointReferenceType (as specified
- 411 by WS-Addressing). It specifies the endpoint reference to which messages containing
- 412 SequenceAcknowledgement header blocks and faults related to the created Sequence are to be sent,
- 413 unless otherwise noted in this specification (for example, see Section 3.5).
- Implementations MUST NOT use an endpoint reference in the AcksTo element that would prevent the
- 411 sending of Sequence Acknowledgements back to the RM Source. For example, using the WS-Addressing

- 410 "http://www.w3.org/2005/08/addressing/none" IRI would make it impossible for the RM Destination to ever
- 411 send Sequence Acknowledgements.
- 410 /wsrm:CreateSequenceResponse/wsrm:Accept/{any}
- 410 This is an extensibility mechanism to allow different (extensible) types of information, based on a schema,
- 411 to be passed.
- 410 /wsrm:CreateSequenceResponse/wsrm:Accept/@{any}
- 410 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 411 element.
- 410 /wsrm:CreateSequenceResponse/{any}
- 410 This is an extensibility mechanism to allow different (extensible) types of information, based on a schema,
- 411 to be passed.
- 410 /wsrm:CreateSequenceResponse/@{any}
- 410 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 411 element.

## 410 3.5 Closing A Sequence

- There are times during the use of an RM Sequence that the RM Source or RM Destination will wish to
- 411 discontinue using a Sequence. Simply terminating the Sequence discards the state managed by the RM
- 412 Destination, leaving the RM Source unaware of the final ranges of messages that were successfully
- transferred to the RM Destination. To ensure that the Sequence ends with a known final state either the
- 414 RM Source or RM Destination MAY choose to close the Sequence before terminating it.
- 410 If the RM Source wishes to close the Sequence, then it sends a CloseSequence element, in the body of
- 411 a message, to the RM Destination. This message indicates that the RM Destination MUST NOT accept
- 412 any new messages for the specified Sequence, other than those already accepted at the time the
- 413 CloseSequence element is interpreted by the RM Destination. Upon receipt of this message, or
- 414 subsequent to the RM Destination closing the Sequence of its own volition, the RM Destination MUST
- 415 include a final SequenceAcknowledgement (within which the RM Destination MUST include the Final
- 416 element) header block on any messages associated with the Sequence destined to the RM Source,
- 417 including the CloseSequenceResponse message or on any Sequence fault Transmitted to the RM
- 418 Source.
- 410 To allow the RM Destination to determine if it has received all of the messages in a Sequence, the RM
- 411 Source SHOULD include the LastMsgNumber element in any CloseSequence messages it sends. The
- 412 RM Destination can use this information, for example, to implement the behavior indicated by
- 413 /wsrm:CreateSequenceResponse/wsrm:IncompleteSequenceBehavior. The value of the
- 414 LastMsgNumber element MUST be the same in all the CloseSequence messages for the closing
- 415 Sequence.
- 410 If the RM Destination decides to close a Sequence of its own volition, it MAY inform the RM Source of this
- 411 event by sending a CloseSequence element, in the body of a message, to the AcksTo EPR of that
- 412 Sequence. The RM Destination MUST include a final SequenceAcknowledgement (within which the RM
- 413 Destination MUST include the Final element) header block in this message and any subsequent
- 414 messages associated with the Sequence destined to the RM Source.
- 410 While the RM Destination MUST NOT accept any new messages for the specified Sequence it MUST still
- 411 process Sequence Lifecyle Messages and Acknowledgement Requests. For example, it MUST respond to

- 410 AckRequested, TerminateSequence as well as CloseSequence messages. Note, subsequent
- 411 CloseSequence messages have no effect on the state of the Sequence.
- 410 In the case where the RM Destination wishes to discontinue use of a Sequence it is RECOMMENDED
- 411 that it close the Sequence. Please see Final and the SequenceClosed fault. Whenever possible the
- 412 SequenceClosed fault SHOULD be used in place of the SequenceTerminated fault to allow the RM
- 413 Source to still Receive Acknowledgements.
- The following exemplar defines the CloseSequence syntax:

- 410 The following describes the content model of the CloseSequence element.
- 410 /wsrm:CloseSequence
- This element MAY be sent by an RM Source to indicate that the RM Destination MUST NOT accept any
- 411 new messages for this Sequence This element MAY also be sent by an RM Destination to indicate that it
- 412 will not accept any new messages for this Sequence.
- 410 /wsrm:CloseSequence/wsrm:Identifier
- The RM Source or RM Destination MUST include this element in any CloseSequence messages it sends.
- 411 The RM Source or RM Destination MUST set the value of this element to the absolute URI (conformant
- 412 with RFC3986) of the closing Sequence.
- 410 /wsrm:CloseSequence/wsrm:LastMessageNumber
- 410 The RM Source SHOULD include this element in any CloseSequence message it sends. The
- 411 LastMsqNumber element specifies the highest assigned message number of all the Sequence Traffic
- 412 Messages for the closing Sequence.
- 410 /wsrm:CloseSequence/wsrm:Identifier/@{any}
- 410 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 411 element.
- 410 /wsrm:CloseSequence/{any}
- This is an extensibility mechanism to allow different (extensible) types of information, based on a schema,
- 411 to be passed.
- 410 /wsrm:CloseSequence@{any}
- 410 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 411 element.
- 410 A CloseSequenceResponse is sent in the body of a message in response to receipt of a
- 411 CloseSequence request message. It indicates that the responder has closed the Sequence.
- 410 The following exemplar defines the CloseSequenceResponse syntax:

The following describes the content model of the CloseSequenceResponse element.

- 410 /wsrm:CloseSequenceResponse
- 410 This element is sent in the body of a message in response to receipt of a CloseSequence request
- 411 message. It indicates that the responder has closed the Sequence.
- 410 /wsrm:CloseSequenceResponse/wsrm:Identifier
- 410 The responder (RM Source or RM Destination) MUST include this element in any
- 411 CloseSequenceResponse message it sends. The responder MUST set the value of this element to the
- absolute URI (conformant with RFC3986) of the closing Sequence.
- 410 /wsrm:CloseSequenceResponse/wsrm:Identifier/@{any}
- 410 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 411 element.
- 410 /wsrm:CloseSequenceResponse/{any}
- 410 This is an extensibility mechanism to allow different (extensible) types of information, based on a schema,
- 411 to be passed.
- 410 /wsrm:CloseSequenceResponse@{any}
- 410 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 411 element.

## 10 3.6 Sequence Termination

- 410 When the RM Source has completed its use of the Sequence it sends a TerminateSequence element,
- in the body of a message, to the RM Destination to indicate that the Sequence is complete and that it will
- 412 not be sending any further messages related to the Sequence. The RM Destination can safely reclaim any
- 413 resources associated with the Sequence upon receipt of the TerminateSequence message. Under
- 414 normal usage the RM Source will complete its use of the Sequence when all of the messages in the
- 415 Sequence have been acknowledged. However, the RM Source is free to Terminate or Close a Sequence
- at any time regardless of the acknowledgement state of the messages.
- 410 To allow the RM Destination to determine if it has received all of the messages in a Sequence, the RM
- 411 Source SHOULD include the LastMsqNumber element in any TerminateSequence messages it sends.
- 412 The RM Destination can use this information, for example, to implement the behavior indicated by
- 413 /wsrm:CreateSequenceResponse/wsrm:IncompleteSequenceBehavior. The value of the
- 414 LastMsqNumber element in the TerminateSequence message MUST be equal to the value of the
- 415 LastMsgNumber element in any CloseSequence message(s) sent by the RM Source for the same
- 416 Sequence.
- 410 If the RM Destination decides to terminate a Sequence of its own volition, it MAY inform the RM Source of
- 411 this event by sending a TerminateSequence element, in the body of a message, to the AcksTo EPR for
- 412 that Sequence. The RM Destination MUST include a final SequenceAcknowledgement (within which
- the RM Destination MUST include the Final element) header block in this message.
- 410 The following exemplar defines the TerminateSequence syntax:

410 The following describes the content model of the TerminateSequence element.

- 410 /wsrm:TerminateSequence
- 410 This element MAY be sent by an RM Source to indicate it has completed its use of the Sequence. It
- 411 indicates that the RM Destination can safely reclaim any resources related to the identified Sequence. The
- 412 RM Source MUST NOT send this element as a header block. The RM Source MAY retransmit this
- 413 element. Once this element is sent, other than this element, the RM Source MUST NOT send any
- 414 additional message to the RM Destination referencing this Sequence.
- 410 This element MAY also be sent by the RM Destination to indicate that it has unilaterally terminated the
- 411 Sequence. Upon sending this message the RM Destination MUST NOT accept any additional messages
- 412 (with the exception of the corresponding TerminateSequenceResponse) for this Sequence. Upon
- 413 receipt of a TerminateSequence the RM Source MUST NOT send any additional messages (with the
- 414 exception of the corresponding TerminateSequenceResponse) for this Sequence.
- 410 /wsrm:TerminateSequence/wsrm:Identifier
- 410 The RM Source or RM Destination MUST include this element in any TerminateSequence message it
- 411 sends. The RM Source or RM Destination MUST set the value of this element to the absolute URI
- 412 (conformant with RFC3986) of the terminating Sequence.
- 410 /wsrm:TerminateSequence/wsrm:LastMsgNumber
- The RM Source SHOULD include this element in any TerminateSequence message it sends. The
- 411 LastMsqNumber element specifies the highest assigned message number of all the Sequence Traffic
- 412 Messages for the closing Sequence.
- 410 /wsrm:TerminateSequence/wsrm:Identifier/@{any}
- 410 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 411 element.
- 410 /wsrm:TerminateSequence/{any}
- 410 This is an extensibility mechanism to allow different (extensible) types of information, based on a schema,
- 411 to be passed.
- 410 /wsrm:TerminateSequence/@{any}
- 410 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 411 element.
- 410 A TerminateSequenceResponse is sent in the body of a message in response to receipt of a
- 411 TerminateSequence request message. It indicates that responder has terminated the Sequence.
- 410 The following exemplar defines the TerminateSequenceResponse syntax:

- 410 The following describes the content model of the TerminateSequence element.
- 410 /wsrm:TerminateSequenceResponse
- 410 This element is sent in the body of a message in response to receipt of a TerminateSequence request
- 411 message. It indicates that the responder has terminated the Sequence. The responder MUST NOT send
- 412 this element as a header block.
- 410 /wsrm:TerminateSequenceResponse/wsrm:Identifier

- 410 The responder (RM Source or RM Destination) MUST include this element in any
- 411 TerminateSequenceResponse message it sends. The responder MUST set the value of this element
- 412 to the absolute URI (conformant with RFC3986) of the terminating Sequence.
- 410 /wsrm:TerminateSequenceResponse/wsrm:Identifier/@{any}
- 410 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 411 element.
- 410 /wsrm:TerminateSequenceResponse/{any}
- This is an extensibility mechanism to allow different (extensible) types of information, based on a schema,
- 411 to be passed.
- 410 /wsrm:TerminateSequenceResponse/@{any}
- 410 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 411 element.
- 410 On receipt of a TerminateSequence message the receiver (RM Source or RM Destination) MUST
- 411 respond with a corresponding TerminateSequenceResponse message or generate a fault
- 412 UnknownSequenceFault if the Sequence is not known.

#### 410 3.7 Sequences

- 410 The RM protocol uses a Sequence header block to track and manage the reliable transfer of messages.
- 411 The RM Source MUST include a Sequence header block in all messages for which reliable transfer is
- 412 REQUIRED. The RM Source MUST identify Sequences with unique Identifier elements and the RM
- 413 Source MUST assign each message within a Sequence a MessageNumber element that increments by 1
- 414 from an initial value of 1. These values are contained within a Sequence header block accompanying
- each message being transferred in the context of a Sequence.
- 410 The RM Source MUST NOT include more than one Sequence header block in any message.
- 410 A following exemplar defines its syntax:

- 410 The following describes the content model of the Sequence header block.
- 410 /wsrm:Sequence
- 410 This protocol element associates the message in which it is contained with a previously established RM
- 411 Sequence. It contains the Sequence's unique identifier and the containing message's ordinal position
- 412 within that Sequence. The RM Destination MUST understand the Sequence header block. The RM
- 413 Source MUST assign a mustUnderstand attribute with a value 1/true (from the namespace
- 414 corresponding to the version of SOAP to which the Sequence SOAP header block is bound) to the
- 415 Sequence header block element.
- 410 /wsrm:Sequence/wsrm:Identifier
- 410 An RM Source that includes a Sequence header block in a SOAP envelope MUST include this element in
- that header block. The RM Source MUST set the value of this element to the absolute URI (conformant
- with RFC3986) that uniquely identifies the Sequence.

- 410 /wsrm:Sequence/wsrm:Identifier/@{any}
- 410 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 411 element.
- 410 /wsrm:Sequence/wsrm:MessageNumber
- 410 The RM Source MUST include this element within any Sequence headers it creates. This element is of
- 411 type MessageNumberType. It represents the ordinal position of the message within a Sequence.
- 412 Seguence message numbers start at 1 and monotonically increase by 1 throughout the Seguence. See
- 413 Section 4.5 for Message Number Rollover fault.
- 410 /wsrm:Sequence/{any}
- 410 This is an extensibility mechanism to allow different types of information, based on a schema, to be
- 411 passed.
- 410 /wsrm:Sequence/@{any}
- 410 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 411 element.
- The following example illustrates a Sequence header block.

## 410 3.8 Request Acknowledgement

- 410 The purpose of the AckRequested header block is to signal to the RM Destination that the RM Source is
- 411 requesting that a SequenceAcknowledgement be sent.
- 410 The RM Source MAY request an Acknowledgement Message from the RM Destination at any time by
- 411 independently transmitting an AckRequested header block (i.e. as a header of a SOAP envelope with an
- 412 empty body). Alternatively the RM Source MAY include an AckRequested header block in any message
- 413 targeted to the RM Destination. The RM Destination SHOULD process AckRequested header blocks
- 414 that are included in any message it receives. If a non-mustUnderstand fault occurs when processing an
- 415 AckRequested header block that was piggy-backed, a fault MUST be generated, but the processing of
- 416 the original message MUST NOT be affected.
- 410 An RM Destination that Receives a message that contains an AckRequested header block MUST send
- 411 a message containing a SequenceAcknowledgement header block to the AcksTo endpoint reference
- 412 (see Section 3.4) for a known Sequence or else generate an UnknownSequence fault. It is
- 413 RECOMMENDED that the RM Destination return a AcknowledgementRange or None element instead
- 414 of a Nack element (see Section 3.9).
- 410 The following exemplar defines its syntax:

- 410 The following describes the content model of the AckRequested header block.
- 410 /wsrm:AckRequested
- This element requests an Acknowledgement for the identified Sequence.

- 410 /wsrm:AckRequested/wsrm:Identifier
- 410 An RM Source that includes an AckRequested header block in a SOAP envelope MUST include this
- element in that header block. The RM Source MUST set the value of this element to the absolute URI,
- 412 (conformant with RFC3986), that uniquely identifies the Sequence to which the request applies.
- 410 /wsrm:AckRequested/wsrm:Identifier/@{any}
- 410 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 411 element.
- 410 /wsrm:AckRequested/{any}
- 410 This is an extensibility mechanism to allow different (extensible) types of information, based on a schema,
- 411 to be passed.
- 410 /wsrm:AckRequested/@{any}
- 410 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 411 element.

## 410 3.9 Sequence Acknowledgement

- 410 The RM Destination informs the RM Source of successful message receipt using a
- 411 SequenceAcknowledgement header block. Acknowledgements can be explicitly requested using the
- 412 AckRequested directive (see Section 3.8).
- 410 The RM Destination MAY Transmit the SequenceAcknowledgement header block independently (i.e.
- 411 As a header of a SOAP envelope with an empty body). Alternatively, an RM Destination MAY include a
- 412 SequenceAcknowledgement header block on any SOAP envelope targeted to the endpoint referenced
- 413 by the AcksTo EPR. The RM Source SHOULD process SequenceAcknowledgement header blocks
- that are included in any message it receives. If a non-mustUnderstand fault occurs when processing a
- 415 SequenceAcknowledgement header that was piggy-backed, a fault MUST be generated, but the
- 416 processing of the original message MUST NOT be affected.
- During creation of a Sequence the RM Source MAY specify the WS-Addressing anonymous IRI as the
- 411 address of the AcksTo EPR for that Sequence. When the RM Source specifies the WS-Addressing
- 412 anonymous IRI as the address of the AcksTo EPR, the RM Destination MUST Transmit any
- 413 SequenceAcknowledgement headers for the created Sequence in a SOAP envelope to be Transmitted
- 414 on the protocol binding-specific back-channel. Such a channel is provided by the context of a Received
- 415 message containing a SOAP envelope that contains a Sequence header block and/or an AckRequested
- 416 header block for that same Sequence identifier. When the RM Destination receives an AckRequested
- 417 header, and the AckTo EPR for that sequence is the WS-Addressing anonymous IRI, the RM Destination
- 418 SHOULD respond on the protocol binding-specific back-channel provided by the Received message
- 419 containing the AckRequested header block.
- 410 The following exemplar defines its syntax:

```
410
        <wsrm:SequenceAcknowledgement ...>
            <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
410
410
             [ [ [ <wsrm:AcknowledgementRange ...
410
                     Upper="wsrm:MessageNumberType"
410
                     Lower="wsrm:MessageNumberType"/> +
410
                 | <wsrm:None/> ]
410
                 <wsrm:Final/> ? ]
410
             | <wsrm:Nack> wsrm:MessageNumberType </wsrm:Nack> + ]
410
410
```

#### 410 </wsrm:SequenceAcknowledgement>

- 410 The following describes the content model of the SequenceAcknowledgement header block.
- 410 /wsrm:SequenceAcknowledgement
- 410 This element contains the Sequence Acknowledgement information.
- 410 /wsrm:SequenceAcknowledgement/wsrm:Identifier
- 410 An RM Destination that includes a SequenceAcknowledgement header block in a SOAP envelope
- 411 MUST include this element in that header block. The RM Destination MUST set the value of this element
- 412 to the absolute URI (conformant with RFC3986) that uniquely identifies the Sequence. The RM
- 413 Destination MUST NOT include multiple SequenceAcknowledgement header blocks that share the
- 414 same value for Identifier within the same SOAP envelope.
- 410 /wsrm:SequenceAcknowledgement/wsrm:Identifier/@{any}
- 410 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 411 element.
- 410 /wsrm:SequenceAcknowledgement/wsrm:AcknowledgementRange
- 410 The RM Destination MAY include one or more instances of this element within a
- 411 SequenceAcknowledgement header block. It contains a range of Sequence message numbers
- 412 successfully accepted by the RM Destination. The ranges MUST NOT overlap. The RM Destination
- 413 MUST NOT include this element if a sibling Nack or None element is also present as a child of
- 414 SequenceAcknowledgement.
- 410 /wsrm:SequenceAcknowledgement/wsrm:AcknowledgementRange/@Upper
- 410 The RM Destination MUST set the value of this attribute equal to the message number of the highest
- 411 contiguous message in a Sequence range accepted by the RM Destination.
- 410 /wsrm:SequenceAcknowledgement/wsrm:AcknowledgementRange/@Lower
- 410 The RM Destination MUST set the value of this attribute equal to the message number of the lowest
- 411 contiguous message in a Seguence range accepted by the RM Destination.
- 410 /wsrm:SequenceAcknowledgement/wsrm:AcknowledgementRange/@{any}
- 410 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 411 element.
- 410 /wsrm:SequenceAcknowledgement/wsrm:None
- 410 The RM Destination MUST include this element within a SequenceAcknowledgement header block if
- 411 the RM Destination has not accepted any messages for the specified Sequence. The RM Destination
- 412 MUST NOT include this element if a sibling AcknowledgementRange or Nack element is also present
- 413 as a child of the SequenceAcknowledgement.
- 410 /wsrm:SequenceAcknowledgement/wsrm:Final
- 410 The RM Destination MAY include this element within a SequenceAcknowledgement header block. This
- 411 element indicates that the RM Destination is not receiving new messages for the specified Sequence. The
- 412 RM Source can be assured that the ranges of messages acknowledged by this
- 413 SequenceAcknowledgement header block will not change in the future. The RM Destination MUST
- 414 include this element when the Sequence is closed. The RM Destination MUST NOT include this element
- 415 when sending a Nack; it can only be used when sending AcknowledgementRange elements or a None.

- 410 /wsrm:SequenceAcknowledgement/wsrm:Nack
- 411 The RM Destination MAY include this element within a SequenceAcknowledgement header block. If
- 412 used, the RM Destination MUST set the value of this element to a MessageNumberType representing
- the MessageNumber of an unreceived message in a Sequence. The RM Destination MUST NOT include
- 414 a Nack element if a sibling AcknowledgementRange or None element is also present as a child of
- 415 SequenceAcknowledgement. Upon the receipt of a Nack, an RM Source SHOULD retransmit the
- 416 message identified by the Nack. The RM Destination MUST NOT issue a SequenceAcknowledgement
- 417 containing a Nack for a message that it has previously acknowledged within a
- 418 AcknowledgementRange. The RM Source SHOULD ignore a SequenceAcknowledgement containing
- 419 a Nack for a message that has previously been acknowledged within a AcknowledgementRange.
- 420 /wsrm:SequenceAcknowledgement/{any}
- 421 This is an extensibility mechanism to allow different (extensible) types of information, based on a schema,
- 422 to be passed.
- 423 /wsrm:SequenceAcknowledgement/@{any}
- 424 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 425 element.

432 433

440

- 426 The following examples illustrate SequenceAcknowledgement elements:
- Message numbers 1...10 inclusive in a Sequence have been accepted by the RM Destination.

 Message numbers 1..2, 4..6, and 8..10 inclusive in a Sequence have been accepted by the RM Destination, messages 3 and 7 have not been accepted.

```
434
435
436
437
438
438
439
439

<mre>
<mre
```

• Message number 3 in a Sequence has not been accepted by the RM Destination.

## 445 4 Faults

- 445 Faults for the CreateSequence message exchange are treated as defined in WS-Addressing. Create
- Sequence Refused is a possible fault reply for this operation. Unknown Sequence is a fault generated by
- 447 Endpoints when messages carrying RM header blocks targeted at unrecognized or terminated Sequences
- 448 are detected. WSRM Required is a fault generated an RM Destination that requires the use of WS-RM on
- a Received message that did not use the protocol. All other faults in this section relate to known
- 450 Sequences. Destinations that generate faults related to known sequences SHOULD transmit those faults.
- 451 If transmitted, such faults MUST be transmitted to the same [destination] as Acknowledgement
- 452 messages.
- 445 Entities that generate WS-ReliableMessaging faults MUST include as the [action] property the default fault
- action IRI defined below. The value from the W3C Recommendation is below for informational purposes:

```
http://docs.oasis-open.org/ws-rx/wsrm/200608/fault
```

- The faults defined in this section are generated if the condition stated in the preamble is met. Fault
- 446 handling rules are defined in section 6 of WS-Addressing SOAP Binding.
- The definitions of faults use the following properties:
- 445 [Code] The fault code.
- 445 [Subcode] The fault subcode.
- 445 [Reason] The English language reason element.
- [Detail] The detail element(s). If absent, no detail element is defined for the fault. If more than one detail
- 446 element is defined for a fault, implementations MUST include the elements in the order that they are
- 447 specified.
- 445 Entities that generate WS-ReliableMessaging faults MUST set the [Code] property to either "Sender" or
- 446 "Receiver". These properties are serialized into text XML as follows:

<b>SOAP Version</b>	Sender	Receiver
SOAP 1.1	S11:Client	S11:Server
SOAP 1.2	S:Sender	S:Receiver

The properties above bind to a SOAP 1.2 fault as follows:

```
445
        <S:Envelope>
         <S: Header>
445
445
            <wsa:Action>
445
               http://docs.oasis-open.org/ws-rx/wsrm/200608/fault
445
            </wsa:Action>
445
           <!-- Headers elided for brevity. -->
445
         </S:Header>
445
         <S:Body>
445
          <S:Fault>
445
            <S:Code>
445
              <S:Value> [Code] </S:Value>
445
              <S:Subcode>
445
               <S:Value> [Subcode] </S:Value>
445
              </S:Subcode>
445
            </S:Code>
445
            <S:Reason>
445
              <S:Text xml:lang="en"> [Reason] </S:Text>
445
            </S:Reason>
445
            <S:Detail>
```

```
445 [Detail]
445 ...
445 </S:Detail>
445 </S:Fault>
445 </S:Body>
445 </S:Envelope>
```

The properties above bind to a SOAP 1.1 fault as follows when the fault is triggered by processing an RM header block:

```
<S11:Envelope>
445
445
         <S11: Header>
445
            <wsrm:SequenceFault>
             <wsrm:FaultCode> wsrm:FaultCodes </wsrm:FaultCode>
445
             <wsrm:Detail> [Detail] </wsrm:Detail>
445
445
445
           </wsrm:SequenceFault>
445
           <!-- Headers elided for brevity. -->
445
         </S11:Header>
445
         <S11:Body>
445
          <S11:Fault>
445
           <faultcode> [Code] </faultcode>
445
           <faultstring> [Reason] </faultstring>
445
          </S11:Fault>
445
         </S11:Bodv>
445
        </S11:Envelope>
```

The properties bind to a SOAP 1.1 fault as follows when the fault is generated as a result of processing a CreateSequence request message:

```
<S11:Envelope>
445
         <S11:Body>
445
445
           <S11:Fault>
            <faultcode> [Subcode] </faultcode>
445
           <faultstring> [Reason] </faultstring>
445
445
           </S11:Fault>
445
         </S11:Body>
445
         </S11:Envelope>
```

## 4.1 SequenceFault Element

- 445 The purpose of the SequenceFault element is to carry the specific details of a fault generated during
- 446 the reliable messaging specific processing of a message belonging to a Sequence. WS-
- 447 ReliableMessaging nodes MUST use the SequenceFault container only in conjunction with the SOAP
- $\textbf{448} \quad \textbf{1.1 fault mechanism. WS-Reliable Messaging nodes MUST NOT use the {\tt SequenceFault container in the properties of the temperature of$
- 449 conjunction with the SOAP 1.2 binding.
- 445 The following exemplar defines its syntax:

- The following describes the content model of the SequenceFault element.
- 445 /wsrm:SequenceFault
- 445 This is the element containing Sequence information for WS-ReliableMessaging

- 445 /wsrm:SequenceFault/wsrm:FaultCode
- 445 WS-ReliableMessaging nodes that generate a SequenceFault MUST set the value of this element to a
- 446 qualified name from the set of fault [Subcodes] defined below.
- 445 /wsrm:SequenceFault/wsrm:Detail
- 445 This element, if present, carries application specific error information related to the fault being described.
- 445 /wsrm:SequenceFault/wsrm:Detail/{any}
- The application specific error information related to the fault being described.
- 445 /wsrm:SequenceFault/wsrm:Detail/@{any}
- The application specific error information related to the fault being described.
- 445 /wsrm:SequenceFault/{any}
- This is an extensibility mechanism to allow different (extensible) types of information, based on a schema,
- 446 to be passed.
- 445 /wsrm:SequenceFault/@{any}
- 445 This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the
- 446 element.

## 445 4.2 Sequence Terminated

- 445 The Endpoint that generates this fault SHOULD make every reasonable effort to notify the corresponding
- 446 Endpoint of this decision.
- 445 Properties:
- 445 [Code] Sender or Receiver
- 445 [Subcode] wsrm:SequenceTerminated
- <sup>445</sup> [Reason] The Sequence has been terminated due to an unrecoverable error.
- 445 [Detail]
- 445 <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>

Generated by	Condition	Action Upon Generation	Action Upon Receipt
RM Source or RM Destination.	Encountering an unrecoverable condition or detection of violation of the protocol.	Sequence termination.	MUST terminate the Sequence if not otherwise terminated.

## 445 4.3 Unknown Sequence

- 445 Properties:
- 445 [Code] Sender
- 445 [Subcode] wsrm:UnknownSequence

- 445 [Reason] The value of wsrm:Identifier is not a known Sequence identifier.
- 445 [Detail]
- 445 <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>

Generated by	Condition	Action Upon Generation	Action Upon Receipt
RM Source or RM Destination.	In response to a message containing an unknown or terminated Sequence identifier.	None.	MUST terminate the Sequence if not otherwise terminated.

## 445 4.4 Invalid Acknowledgement

- An example of when this fault is generated is when a message is Received by the RM Source containing
- 446 a SequenceAcknowledgement covering messages that have not been sent.
- 445 [Code] Sender
- 445 [Subcode] wsrm:InvalidAcknowledgement
- 445 [Reason] The SequenceAcknowledgement violates the cumulative Acknowledgement invariant.
- 445 [Detail]
- 445 <wsrm:SequenceAcknowledgement ...> ... </wsrm:SequenceAcknowledgement>

Generated by	Condition	Action Upon Generation	Action Upon Receipt
RM Source.	In response to a SequenceAknowledge ment that violate the invariants stated in 2.3 or any of the requirements in 3.9 about valid combinations of AckRange, Nack and None in a single SequenceAcknowledg ement element or with respect to already Received such elements.	Unspecified.	Unspecified.

## 445 4.5 Message Number Rollover

- 445 If the condition listed below is reached, the RM Destination MUST generate this fault.
- 445 Properties:
- 445 [Code] Sender
- 445 [Subcode] wsrm:MessageNumberRollover
- [Reason] The maximum value for wsrm:MessageNumber has been exceeded.

446

445 <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>

<wsrm:MaxMessageNumber> wsrm:MessageNumberType </wsrm:MaxMessageNumber>

Generated by	Condition	Action Upon Generation	Action Upon Receipt
RM Destination.	Message number in /wsrm:Sequence/wsr m:MessageNumber of a Received message exceeds the internal limitations of an RM Destination or reaches the maximum value of 9,223,372,036,854,775,8 07.	RM Destination SHOULD continue to accept undelivered messages until the Sequence is closed or terminated.	RM Source SHOULD continue to retransmit undelivered messages until the Sequence is closed or terminated.

## 445 4.6 Create Sequence Refused

- 445 Properties:
- 445 [Code] Sender or Receiver
- 445 [Subcode] wsrm:CreateSequenceRefused
- [Reason] The Create Sequence request has been refused by the RM Destination.
- 445 [Detail]
- 445 xs:any

Generated by	Condition	Action Upon Generation	Action Upon Receipt
RM Destination.	In response to a CreateSequence message when the RM Destination does not wish to create a new Sequence.	Unspecified.	Sequence terminated.

## 445 4.7 Sequence Closed

- This fault is generated by an RM Destination to indicate that the specified Sequence has been closed.
- 446 This fault MUST be generated when an RM Destination is asked to accept a message for a Sequence that
- 447 is closed.
- 445 Properties:
- 445 [Code] Sender
- 445 [Subcode] wsrm:SequenceClosed
- 445 [Reason] The Sequence is closed and can not accept new messages.

445

<wsrm:Identifier...> xs:anyURI </wsrm:Identifier>

Generated by	Condition	Action Upon Generation	Action Upon Receipt
RM Destination.	In response to a message that belongs to a Sequence that is already closed.	Unspecified.	Sequence closed.

## 445 4.8 WSRM Required

- 1445 If an RM Destination requires the use of WS-RM, this fault is generated when it Receives an incoming
- 446 message that did not use this protocol.
- 445 Properties:
- 445 [Code] Sender
- 445 [Subcode] wsrm:WSRMRequired
- [Reason] The RM Destination requires the use of WSRM.
- 445 [Detail]
- 445 xs:any

## **5 Security Threats and Countermeasures**

- This specification considers two sets of security requirements, those of the applications that use the WS-
- 446 RM protocol and those of the protocol itself.
- 445 This specification makes no assumptions about the security requirements of the applications that use WS-
- RM. However, once those requirements have been satisfied within a given operational context, the
- 447 addition of WS-RM to this operational context should not undermine the fulfillment of those requirements;
- 448 the use of WS-RM should not create additional attack vectors within an otherwise secure system.
- There are many other security concerns that one may need to consider when implementing or using this
- 446 protocol. The material below should not be considered as a "check list". Implementers and users of this
- 447 protocol are urged to perform a security analysis to determine their particular threat profile and the
- 448 appropriate responses to those threats.
- 445 Implementers are also advised that there is a core tension between security and reliable messaging that
- 446 can be problematic if not addressed by implementations; one aspect of security is to prevent message
- 447 replay but one of the invariants of this protocol is to resend messages until they are acknowledged.
- 448 Consequently, if the security sub-system processes a message but a failure occurs before the reliable
- 449 messaging sub-system Receives that message, then it is possible (and likely) that the security sub-system
- will treat subsequent copies as replays and discard them. At the same time, the reliable messaging sub-
- 451 system will likely continue to expect and even solicit the missing message(s). Care should be taken to
- 452 avoid and prevent this condition.

#### 5.1 Threats and Countermeasures

- The primary security requirement of this protocol is to protect the specified semantics and protocol
- 446 invariants against various threats. The following sections describe several threats to the integrity and
- 447 operation of this protocol and provide some general outlines of countermeasures to those threats.
- 448 Implementers and users of this protocol should keep in mind that all threats are not necessarily applicable
- 449 to all operational contexts.

### 445 5.1.1 Integrity Threats

- 445 In general, any mechanism which allows an attacker to alter the information in a Sequence Traffic
- 446 Message, Seguence Lifecycle Message, Acknowledgement Messages, Acknowledgement Request, or
- 447 Sequence-related fault, or which allows an attacker to alter the correlation of a RM Protocol Header Block
- 448 to its intended message represents a threat to the WS-RM protocol.
- 445 For example, if an attacker is able to swap Sequence headers on messages in transit between the RM
- 446 Source and RM Destination then they have undermined the implementation's ability to guarantee the first
- 447 invariant described in Section 2.3. The result is that there is no way of guaranteeing that messages will be
- Delivered to the Application Destination in the same order that they were sent by the Application Source.

#### 5.1.1.1 Countermeasures

- 445 Integrity threats are generally countered via the use of digital signatures some level of the communication
- 446 protocol stack. Note that, in order to counter header swapping attacks, the signature SHOULD include
- both the SOAP body and any relevant SOAP headers (e.g. Sequence header). Because some headers
- 448 (AckRequested, SequenceAcknowledgement) are independent of the body of the SOAP message in which
- they occur, implementations MUST allow for signatures that cover only these headers.

#### 445 5.1.2 Resource Consumption Threats

- 445 The creation of a Sequence with an RM Destination consumes various resources on the systems used to
- 446 implement that RM Destination. These resources can include network connections, database tables,
- 447 message queues, etc. This behavior can be exploited to conduct denial of service attacks against an RM
- 448 Destination. For example, a simple attack is to repeatedly send CreateSequence messages to an RM
- 449 Destination. Another attack is to create a Sequence for a service that is known to require in-order
- 450 message Delivery and use this Sequence to send a stream of very large messages to that service,
- 451 making sure to omit message number "1" from that stream.

#### 445 5.1.2.1 Countermeasures

- 445 There are a number of countermeasures against the described resource consumption threats. The
- 446 technique advocated by this specification is for the RM Destination to restrict the ability to create a
- 447 Seguence to a specific set of entities/principals. This reduces the number of potential attackers and, in
- some cases, allows the identity of any attackers to be determined.
- The ability to restrict Sequence creation depends, in turn, upon the RM Destination's ability identify and
- authenticate the RM Source that issued the CreateSequence message.

#### **5.1.3 Sequence Spoofing Threats**

- 445 Sequence spoofing is a class of threats in which the attacker uses knowledge of the Identifier for a
- 446 particular Sequence to forge Sequence Lifecycle or Traffic Messages. For example the attacker creates a
- 447 fake TerminateSequence message that references the target Sequence and sends this message to the
- 448 appropriate RM Destination. Some sequence spoofing attacks also require up-to-date knowledge of the
- 449 current MessageNumber for their target Seguence.
- 445 In general any Sequence Lifecycle Message, RM Protocol Header Block, or sequence-correlated SOAP
- 446 fault (e.g. InvalidAcknowledgement) can be used by someone with knowledge of the Sequence identifier
- 447 to attack the Sequence. These attacks are "two-way" in that an attacker may choose to target the RM
- 448 Source by, for example, inserting a fake SequenceAcknowledgement header into a message that it sends
- 449 to the AcksTo EPR of an RM Source.

#### 445 5.1.3.1 Sequence Hijacking

- 445 Sequence hijacking is a specific case of a sequence spoofing attack. The attacker attempts to inject
- 446 Seguence Traffic Messages into an existing Sequence by inserting fake sequence headers into those
- 447 messages.
- Note that "sequence hijacking" should not be equated with "security session hijacking". Although a
- 446 Sequence may be bound to some form of a security session in order to counter the threats described in
- 447 this section, applications MUST NOT rely on WS-RM-related information to make determinations about
- 448 the identity of the entity that created a message; applications SHOULD rely only upon information that is
- 449 established by the security infrastructure to make such determinations. Failure to observe this rule
- 450 creates, among other problems, a situation in which the absence of WS-RM may deprive an application of
- the ability to authenticate its peers even though the necessary security processing has taken place.

#### 445 5.1.3.2 Countermeasures

- 445 There are a number of countermeasures against sequence spoofing threats. The technique advocated by
- 446 this specification is to consider the Sequence to be a shared resource that is jointly owned by the RM

- 445 Source that initiated its creation (i.e. that sent the CreateSequence message) and the RM Destination that
- 446 serves as its terminus (i.e. that sent the CreateSequenceResponse message). To counter sequence
- 447 spoofing attempts the RM Destination SHOULD ensure that every message or fault that it Receives that
- refers to a particular Sequence originated from the RM Source that jointly owns the referenced Sequence.
- 449 For its part the RM Source SHOULD ensure that every message or fault that it Receives that refers to a
- 450 particular Sequence originated from the RM Destination that jointly owns the referenced Sequence.
- For the RM Destination to be able to identify its sequence peer it MUST be able to identify and
- 446 authenticate the entity that sent the CreateSequence message. Similarly for the RM Source to identify its
- 447 sequence peer it MUST be able to identify and authenticate the entity that sent the
- 448 CreateSequenceResponse message. For either the RM Destination or the RM Source to determine if a
- 449 message was sent by its sequence peer it MUST be able to identify and authenticate the initiator of that
- 450 message and, if necessary, correlate this identity with the sequence peer identity established at sequence
- 451 creation time.

## 5.2 Security Solutions and Technologies

- 445 The security threats described in the previous sections are neither new nor unique. The solutions that
- 446 have been developed to secure other SOAP-based protocols can be used to secure WS-RM as well. This
- 447 section maps the facilities provided by common web services security solutions against countermeasures
- 448 described in the previous sections.
- Before continuing this discussion, however, some examination of the underlying requirements of the
- 446 previously described countermeasures is necessary. Specifically it should be noted that the technique
- described in Section 5.1.2.1 has two components. Firstly, the RM Destination identifies and authenticates
- $\ \, \text{the issuer of a $\tt CreateSequence} \ \, \text{message. Secondly, the RM Destination performs an authorization check} \\$
- against this authenticated identity and determines if the RM Source is permitted to create Sequences with
- 450 the RM Destination. Since the facilities for performing this authorization check (runtime infrastructure,
- 451 policy frameworks, etc.) lie completely within the domain of individual implementations, any discussion of
- such facilities is considered to be beyond the scope of this specification.

## **5.2.1 Transport Layer Security**

- 445 This section describes how the facilities provided by SSL/TLS [RFC 4346] can be used to implement the
- 446 countermeasures described in the previous sections. The use of SSL/TLS is subject to the constraints
- defined in Section 4 of the Basic Security Profile 1.0 [BSP 1.0].
- The description provided here is general in nature and is not intended to serve as a complete definition on
- 446 the use of SSL/TLS to protect WS-RM. In order to interoperate implementations need to agree on the
- 447 choice of features as well as the manner in which they will be used. The mechanisms described in the
- 448 Web Services Security Policy Language [SecurityPolicy] MAY be used by services to describe the
- 449 requirements and constraints of the use of SSL/TLS.

#### 45 5.2.1.1 Model

- 445 The basic model for using SSL/TLS is as follows:
- 1. The RM Source establishes an SSL/TLS session with the RM Destination.
- 2. The RM Source uses this SSL/TLS session to send a CreateSequence message to the RM Destination.

- 3. The RM Destination establishes an SSL/TLS session with the RM Source and sends an asynchronous CreateSequenceResponse using this session. Alternately it may respond with a synchronous CreateSequenceResponse using the session established in (1).
  - 4. For the lifetime of the Sequence the RM Source uses the SSL/TLS session from (1) to Transmit any and all messages or faults that refer to that Sequence.
- 5. For the lifetime of the Sequence the RM Destination either uses the SSL/TLS session established in (3) to Transmit any and all messages or faults that refer to that Sequence or, for synchronous exchanges, the RM Destination uses the SSL/TLS session established in (1).

#### 5.2.1.2 Countermeasure Implementation

445

446

445 446

447

- Used in its simplest fashion (without relying upon any authentication mechanisms), SSL/TLS provides the
- 446 necessary integrity qualities to counter the threats described in Section 5.1.1. Note, however, that the
- 447 nature of SSL/TLS limits the scope of this integrity protection to a single transport level session. If
- 448 SSL/TLS is the only mechanism used to provide integrity, any intermediaries between the RM Source and
- the RM Destination MUST be trusted to preserve the integrity of the messages that flow through them.
- As noted, the technique described in Sections 5.1.2.1 involves the use of authentication. This specification
- 446 advocates either of two mechanisms for authenticating entities using SSL/TLS. In both of these methods
- 447 the SSL/TLS server (the party accepting the SSL/TLS connection) authenticates itself to the SSL/TLS
- 448 client using an X.509 certificate that is exchanged during the SSL/TLS handshake.
- HTTP Basic Authentication: This method of authentication presupposes that a SOAP/HTTP binding is being used as part of the protocol stack beneath WS-RM. Subsequent to the establishment of the SSL/TLS session, the sending party authenticates itself to the receiving party using HTTP Basic Authentication [RFC 2617]. For example, a RM Source might authenticate itself to a RM Destination (e.g. when transmitting a Sequence Traffic Message) using BasicAuth. Similarly the RM Destination might authenticate itself to the RM Source (e.g. when sending an Acknowledgement) using BasicAuth.
  - SSL/TLS Client Authentication: In this method of authentication, the party initiating the
    connection authenticates itself to the party accepting the connection using an X.509 certificate
    that is exchanged during the SSL/TLS handshake.
- 445 To implement the countermeasures described in section 5.1.2.1 the RM Source must authenticate itself
- 446 using one the above mechanisms. The authenticated identity can then be used to determine if the RM
- 447 Source is authorized to create a Sequence with the RM Destination.
- 445 This specification advocates implementing the countermeasures described in section 5.1.3.2 by requiring
- an RM node's Sequence peer to be equivalent to their SSL/TLS session peer. This allows the
- 447 authorization decisions described in section 5.1.3.2 to be based on SSL/TLS session identity rather than
- 448 on authentication information. For example, an RM Destination can determine that a Sequence Traffic
- 449 Message rightfully belongs to its referenced Sequence if that message arrived over the same SSL/TLS
- 450 session that was used to carry the CreateSequence message for that Sequence. Note that requiring a
- one-to-one relationship between SSL/TLS session peer and Sequence peer constrains the lifetime of a
- 452 SSL/TLS-protected Sequence to be less than or equal to the lifetime of the SSL/TLS session that is used
- 453 to protect that Sequence.
- 445 This specification does not preclude the use of other methods of using SSL/TLS to implement the
- 446 countermeasures (such as associating specific authentication information with a Sequence) although such
- methods are not covered by this document.

Issues specific to the life-cycle management of SSL/TLS sessions (such as the resumption of a SSL/TLS
 session) are outside the scope of this specification.

#### 45 5.2.2 SOAP Message Security

- The mechanisms described in WS-Security may be used in various ways to implement the
- 446 countermeasures described in the previous sections. This specification advocates using the protocol
- described by WS-SecureConversation [SecureConversation] (optionally in conjunction with WS-Trust
- 448 [Trust]) as a mechanism for protecting Sequences. The use of WS-Security (as an underlying component
- of WS-SecureConversation) is subject to the constraints defined in the Basic Security Profile 1.0.
- The description provided here is general in nature and is not intended to serve as a complete definition on
- 446 the use of WS-SecureConversation/WS-Trust to protect WS-RM. In order to interoperate implementations
- 447 need to agree on the choice of features as well as the manner in which they will be used. The
- 448 mechanisms described in the Web Services Security Policy Language MAY be used by services to
- describe the requirements and constraints of the use of WS-SecureConversation.

#### 445 5.2.2.1 Model

445

446

447

- The basic model for using WS-SecureConversation is as follows:
- 1. The RM Source and the RM Destination create a WS-SecureConversation security context. This may involve the participation of third parties such as a security token service. The tokens exchanged may contain authentication claims (e.g. X.509 certificates or Kerberos service tickets).
- 2. During the CreateSequence exchange, the RM Source SHOULD explicitly identify the security context that will be used to protect the Sequence. This is done so that, in cases where the CreateSequence message is signed by more than one security context, the RM Source can indicate which security context should be used to protect the newly created Sequence.
  - For the lifetime of the Sequence the RM Source and the RM Destination use the session key(s)
    associated with the security context to sign (as defined by WS-Security) at least the body and any
    relevant WS-RM-defined headers of any and all messages or faults that refer to that Sequence.

#### **5.2.2.2 Countermeasure Implementation**

- Without relying upon any authentication information, the per-message signatures provide the necessary integrity qualities to counter the threats described in Section 5.1.1.
- 445 To implement the countermeasures described in section 5.1.2.1 some mutually agreed upon form of
- authentication claims must be provided by the RM Source to the RM Destination during the establishment
- of the Security Context. These claims can then be used to determine if the RM Source is authorized to
- 448 create a Sequence with the RM Destination.
- 445 This specification advocates implementing the countermeasures described in section 5.1.3.2 by requiring
- 446 an RM node's Sequence peer to be equivalent to their security context session peer. This allows the
- authorization decisions described in section 5.1.3.2 to be based on the identity of the message's security
- 448 context rather than on any authentication claims that may have been established during security context
- 449 initiation. Note that other methods of using WS-SecureConversation to implement the countermeasures
- 450 (such as associating specific authentication claims to a Sequence) are possible but not covered by this
- 451 document.
- 445 As with transport security, the requisite equivalence of a security context peer and with a Sequence peer
- limits the lifetime of a Sequence to the lifetime of the protecting security context. Unlike transport security,

- the association between a Sequence and its protecting security context cannot always be established
- 446 implicitly at Sequence creation time. This is due to the fact that the CreateSequence and
- 447 CreateSequenceResponse messages may be signed by more than one security context.
- 445 Issues specific to the life-cycle management of WS-SecureConversation security contexts (such as
- amending or renewing contexts) are outside the scope of this specification.

## 445 6 Securing Sequences

- 445 As noted in Section 5, the RM Source and RM Destination should be able to protect their shared
- 446 Seguences against the threat of Seguence Spoofing attacks. There are a number of OPTIONAL means of
- 447 achieving this objective depending upon the underlying security infrastructure.

## 445 6.1 Securing Sequences Using WS-Security

- 445 One mechanism for protecting a Sequence is to include a security token using a
- 446 wsse: SecurityTokenReference element from WS-Security (see section 9 in WS-
- 447 SecureConversation) in the CreateSequence element. This establishes an association between the
- 448 created (and, if present, offered) Sequence(s) and the referenced security token, such that the RM Source
- 449 and Destination MUST use the security token as the basis for authorization of all subsequent interactions
- 450 related to the Sequence(s). The wsse:SecurityTokenReference explicitly identifies the token as
- there may be more than one token on a CreateSequence message or inferred from the communication
- 452 context (e.g. transport protection).
- 445 It is RECOMMENDED that a message independent referencing mechanism be used to identify the token,
- 446 if the token being referenced supports such mechanism.
- The following exemplar defines the CreateSequence syntax when extended to include a
- 446 wsse:SecurityTokenReference:

```
445
        <wsrm:CreateSequence ...>
445
            <wsrm:AcksTo> wsa:EndpointReferenceType </wsrm:AcksTo>
445
            <wsrm:Expires ...> xs:duration </wsrm:Expires> ?
445
            <wsrm:Offer ...>
445
                <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
445
                <wsrm:Endpoint> wsa:EndpointReferenceType </wsrm:Endpoint>
445
                <wsrm:Expires ...> xs:duration </wsrm:Expires> ?
445
                <wsrm:IncompleteSequenceBehavior>
445
                     wsrm:IncompleteSequenceBehaviorType
445
                </wsrm:IncompleteSequenceBehavior> ?
445
445
            </wsrm:Offer> ?
445
445
            <wsse:SecurityTokenReference>
445
445
            </wsse:SecurityTokenReference> ?
445
445
        </wsrm:CreateSequence>
```

- The following describes the content model of the additional CreateSequence elements.
- 445 /wsrm:CreateSequence/wsse:SecurityTokenReference
- 445 This element uses the extensibility mechanism defined for the CreateSequence element (defined in
- section 3.4) to communicate an explicit reference to the security token, using a
- 447 wsse: SecurityTokenReference as documented in WS-Security, that the RM Source and Destination
- 448 MUST use to authorize messages for the created (and, if present, the offered) Sequence(s). All
- subsequent messages related to the created (and, if present, the offered) Sequence(s) MUST
- demonstrate proof-of-possession of the secret associated with the token (e.g., by using or deriving from a
- 451 private or secret key).
- When a RM Source transmits a CreateSequence that has been extended to include a
- 446 wsse: SecurityTokenReference it SHOULD ensure that the RM Destination both understands and
- 447 will conform to the requirements listed above. In order to achieve this, the RM Source SHOULD include

- 445 the UsesSequenceSTR element as a SOAP header block within the CreateSequence message. This
- 446 element MUST include a soap: mustUnderstand attribute with a value of 'true'. Thus the RM Source
- 447 can be assured that a RM Destination that responds with a CreateSequenceResponse understands
- and conforms with the requirements listed above. Note that an RM Destination understanding this header
- does not mean that it has processed and understood any WS-Security headers, the fault behavior defined
- 450 in WS-Security still applies.
- 445 The following exemplar defines the UsesSequenceSTR syntax:

```
445 <wsrm:UsesSequenceSTR ... />
```

- 445 The following describes the content model of the UsesSequenceSTR header block.
- 445 /wsrm:UsesSequenceSTR
- This element SHOULD be included as a SOAP header block in CreateSequence messages that use the
- 446 extensibility mechanism described above in this section. The soap: mustUnderstand attribute value
- 447 MUST be 'true'. The receiving RM Destination MUST understand and correctly implement the extension
- 448 described above or else generate a soap: MustUnderstand fault, thus aborting the requested
- 449 Sequence creation.
- The following is an example of a CreateSequence message using the
- 446 wsse:SecurityTokenReference extension and the UsesSequenceSTR header block:

```
445
        <soap:Envelope ...>
445
          <soap:Header>
445
             <wsrm:UsesSequenceSTR soap:mustUnderstand='true'/>
445
445
445
          </soap:Header>
445
          <soap:Body>
445
             <wsrm:CreateSequence>
445
               <wsrm:AcksTo>
                 <wsa:Address>http://Business456.com/serviceA/789</wsa:Address>
445
445
               </wsrm:AcksTo>
445
               <wsse:SecurityTokenReference>
445
445
               </wsse:SecurityTokenReference>
445
             </wsrm:CreateSequence>
445
          </soap:Body>
         </soap:Envelope>
445
```

## 6.2 Securing Sequences Using SSL/TLS

- 445 One mechanism for protecting a Sequence is to bind the Sequence to the underlying SSL/TLS session(s).
- 446 The RM Source indicates to the RM Destination that a Sequence is to be bound to the underlying
- 447 SSL/TLS session(s) via the UsesSequenceSSL header block. If the RM Source wishes to bind a
- 448 Sequence to the underlying SSL/TLS sessions(s) it MUST include the UsesSequenceSSL element as a
- 449 SOAP header block within the CreateSequence message.
- 445 The following exemplar defines the UsesSequenceSSL syntax:

```
<wsrm:UsesSequenceSSL soap:mustUnderstand="true" ... />
```

- 445 The following describes the content model of the UsesSequenceSSL header block.
- 445 /wsrm:UsesSequenceSSL
- 445 The RM Source MAY include this element as a SOAP header block of a CreateSequence message to
- indicate to the RM Destination that the resulting Sequence is to be bound to the SSL/TLS session that was

- 445 used to carry the CreateSequence message. If included, the RM Source MUST mark this header with a
- 446 soap:mustUnderstand attribute with a value of 'true'. The receiving RM Destination MUST understand
- and correctly implement the functionality described in Section 5.2.1 or else generate a
- 448 soap: MustUnderstand fault, thus aborting the requested Sequence creation.
- Note that the use inclusion of the above header by the RM Source implies that all Sequence-related
- 446 information (Sequence Lifecycle or Acknowledgment messages or Sequence-related faults) flowing from
- 447 the RM Destination to the RM Source will be bound to the SSL/TLS session that is used to carry the
- 448 CreateSequenceResponse message.

## 445 Appendix B. WSDL

- This WSDL describes the WS-RM protocol from the point of view of an RM Destination. In the case where
- 446 an endpoint acts both as an RM Destination and an RM Source, note that additional messages may be
- 447 present in exchanges with that endpoint.
- Also note that this WSDL is intended to describe the internal structure of the WS-RM protocol, and will not
- 446 generally appear in a description of a WS-RM-capable Web service. See WS-RM Policy [WS-RM Policy]
- for a higher-level mechanism to indicate that WS-RM is engaged.
- The normative WSDL 1.1 definition for WS-ReliableMessaging is located at:
- 445 http://docs.oasis-open.org/ws-rx/wsrm/200608/wsdl/wsrm-1.1-wsdl-200608.wsdl
- The following non-normative copy is provided for reference.

445
        xmlns:wsa="http://www.w3.org/2005/08/addressing">
445
         <S:Header>
445
          <wsa:MessageID>
445
           http://Business456.com/guid/0baaf88d-483b-4ecf-a6d8-a7c2eb546819
445
          </wsa:MessageID>
445
          <wsa:To>http://example.com/serviceB/123</wsa:To>
445
          <wsa:From>
445
           <wsa:Address>http://Business456.com/serviceA/789</wsa:Address>
```

```
445
          </wsa:From>
          <wsa:Action>http://example.com/serviceB/123/request</wsa:Action>
445
445
          <wsrm:Sequence>
445
           <wsrm:Identifier>http://Business456.com/RM/ABC</wsrm:Identifier>
445
           <wsrm:MessageNumber>3</wsrm:MessageNumber>
445
          </wsrm:Sequence>
          <wsrm:AckRequested>
445
445
            <wsrm:Identifier>http://Business456.com/RM/ABC</wsrm:Identifier>
          </wsrm:AckRequested>
445
445
         </S:Header>
445
         <S:Body>
445
          <!-- Some Application Data -->
445
         </S:Body>
445
        </S:Envelope>
```

## 5 Appendix C.3 First Acknowledgement

Message number 2 has not been accepted by the RM Destination due to some transmission error so it responds with an Acknowledgement for messages 1 and 3:

```
<?xml version="1.0" encoding="UTF-8"?>
445
445
        <S:Envelope xmlns:S="http://www.w3.org/2003/05/soap-envelope"</p>
445
        xmlns:wsrm="http://docs.oasis-open.org/ws-rx/wsrm/200608"
445
        xmlns:wsa="http://www.w3.org/2005/08/addressing">
445
         <S:Header>
445
          <wsa:MessageID>
445
           http://example.com/guid/0baaf88d-483b-4ecf-a6d8-a7c2eb546810
445
          </wsa:MessageID>
          <wsa:To>http://Business456.com/serviceA/789</wsa:To>
445
445
          <wsa:From>
           <wsa:Address>http://example.com/serviceB/123</wsa:Address>
445
445
          </wsa:From>
445
          <wsa:Action>
445
            http://docs.oasis-open.org/ws-rx/wsrm/200608/SequenceAcknowledgement
445
          </wsa:Action>
445
          <wsrm:SequenceAcknowledgement>
445
           <wsrm:Identifier>http://Business456.com/RM/ABC</wsrm:Identifier>
445
           <wsrm:AcknowledgementRange Upper="1" Lower="1"/>
445
           <wsrm:AcknowledgementRange Upper="3" Lower="3"/>
445
          </wsrm:SequenceAcknowledgement>
445
         </S:Header>
445
         <S:Body/>
445
        </S:Envelope>
```

## Appendix C.4 Retransmission

The RM Sourcediscovers that message number 2 was not accepted so it resends the message and requests an Acknowledgement:

```
<?xml version="1.0" encoding="UTF-8"?>
445
445
        <S:Envelope xmlns:S="http://www.w3.org/2003/05/soap-envelope"</p>
445
        xmlns:wsrm="http://docs.oasis-open.org/ws-rx/wsrm/200608"
445
        xmlns:wsa="http://www.w3.org/2005/08/addressing">
445
         <S: Header>
445
          <wsa:MessageID>
445
           http://Business456.com/guid/daa7d0b2-c8e0-476e-a9a4-d164154e38de
445
          </wsa:MessageID>
445
          <wsa:To>http://example.com/serviceB/123</wsa:To>
445
          <wsa:From>
445
           <wsa:Address>http://Business456.com/serviceA/789</wsa:Address>
445
          </wsa:From>
```

```
445
          <wsa:Action>http://example.com/serviceB/123/request</wsa:Action>
445
          <wsrm:Sequence>
445
           <wsrm:Identifier>http://Business456.com/RM/ABC</wsrm:Identifier>
445
           <wsrm:MessageNumber>2</wsrm:MessageNumber>
445
          </wsrm:Sequence>
445
          <wsrm:AckRequested>
445
           <wsrm:Identifier>http://Business456.com/RM/ABC</wsrm:Identifier>
445
          </wsrm:AckRequested>
445
         </S:Header>
445
         <S:Body>
445
          <!-- Some Application Data -->
445
         </S:Body>
445
        </S:Envelope>
```

## 45 Appendix C.5 Termination

The RM Destination now responds with an Acknowledgement for the complete Sequence which can then be terminated:

```
445
        <?xml version="1.0" encoding="UTF-8"?>
        <S:Envelope xmlns:S="http://www.w3.org/2003/05/soap-envelope"</p>
445
445
        xmlns:wsrm="http://docs.oasis-open.org/ws-rx/wsrm/200608"
445
        xmlns:wsa="http://www.w3.org/2005/08/addressing">

# 445 Appendix D. State Tables

- This appendix specifies the non-normative state transition tables for RM Source and RM Destination.
- 445 The state tables describe the lifetime of a sequence in both the RM Source and the RM Destination
- 445 Legend:
- 445 The first column of these tables contains the motivating event and has the following format:

Event	
Event name [source] {ref}	

#### 445 Where:

445

445

- Event Name: indicates the name of the event. Event Names surrounded by "<>" are optional as described by the specification.
- [source]: indicates the source of the event; one of:
- [msg] a Received message
  - [int]: an internal event such as the firing of a timer
- [app]: the application
  - [unspec]: the source is unspecified
- Each event / state combination cell in the tables in this appendix has the following format:

# State Name Action to take [next state] {ref}

#### 445 Where:

445

446

447

445

446

445

- action to take: indicates that the state machine performs the following action. Actions surrounded by "<>" are optional as described by the specification. "Xmit" is used as a short form for the word "Transmit"
- [next state]: indicates the state to which the state machine will advance upon the performance of the action. For ease of reading the next state "same" indicates that the state does not change.
- {ref} is a reference to the document section describing the behavior in this cell
- "N/A" in a cell indicates a state / event combination self-inconsistent with the state machine; should these conditions occur, it would indicate an implementation error. A blank cell indicates that the behavior is not described in this specification and does not indicate normal protocol operation. Implementations MAY generate a Sequence Terminated fault (see section 4.2) in these circumstances. Robust implementations MUST be able to operate in a stable manner despite the occurrence of unspecified event / state combinations.

## 445 Table 1 RM Source Sequence State Transition Table

Events	Sequence States						
Events	None	Creating	Created	Closing	Closed	Terminating	
Create Sequence [unspec] {3.4}	Xmit Create Sequence [Creating] {3.4}	N/A	N/A	N/A	N/A	N/A	
Create Sequence Response [msg] {3.4)		Process Create Sequence Response [Created] {3.4}					
Create Sequence Refused Fault [msg] {3.4}		No action [None] {4.6}					
Send message [app] {2.1}	N/A	N/A	Xmit message [Same] {2}	No action [Same] {2}	N/A	N/A	
Retransmit of un- ack'd message [int]	N/A	N/A	Xmit message [Same] {2.4}	Xmit message [Same] {2.4}	N/A	N/A	
SeqAck (non-final) [msg] {3.9}	Generate Unknown Sequence Fault [Same] {4.3}	Generate Unknown Sequence Fault [Same] {4.3}	Process Ack ranges [Same] {3.9}	Process Ack ranges [Same] {3.9}	Process Ack ranges [Same] {3.9}	Process Ack ranges [Same] {3.9}	
<b>Nack</b> [msg] (3.9)	Generate Unknown Sequence Fault [Same] {4.3}	Generate Unknown Sequence Fault [Same] {4.3}	<xmit message(s)&gt; [Same] {3.9}</xmit 	<xmit message(s)&gt; [Same] {3.9}</xmit 	No action [Same]	No action [Same]	
Message Number Rollover Fault [msg]	Generate Unknown Sequence Fault [Same] {4.3}	Generate Unknown Sequence Fault [Same] {4.3}	No action [Rollover]	No action [Same]	No action [Same]	No action [Same]	
CloseSequence [msg] {3.5}	Generate Unknown Sequence Fault [Same] {4.3}	Generate Unknown Sequence Fault [Same] {4.3}	Xmit CloseSequence Response [Closed] {3.5}	Xmit CloseSequence Response [Closed] {3.5}	Xmit CloseSequence Response [Closed] {3.5}	Generate Unknown Sequence Fault [Same] {4.3}	
<close sequence=""> [int] {3.5}</close>	N/A		Xmit Close Sequence [Closing] {3.5}	N/A	N/A	N/A	
Close Sequence Response [msg] {3.5}	Generate Unknown Sequence Fault [Same] {4.3}	Generate Unknown Sequence Fault [Same] {4.3}		No action [Closed] {3.5}	No action [Same] {3.5}	No action [Same] {3.5}	

Frants	Sequence States					
Events	None	Creating	Created	Closing	Closed	Terminating
SeqAck (final) [msg] {3.9}	Generate Unknown Sequence Fault [Same] {4.3}	Generate Unknown Sequence Fault [Same] {4.3}	Process Ack ranges [Closed] {3.9}	Process Ack ranges [Closed] {3.9}	Process Ack ranges [Same]	Process Ack ranges [Same]
Sequence Closed Fault [msg] {4.7}	Generate Unknown Sequence Fault [Same] {4.3}	Generate Unknown Sequence Fault [Same] {4.3}	No action [Closed] {4.7}	No action [Closed] {4.7}	No action [Same]	No action [Same]
Unknown Sequence Fault [msg] {4.3}			Terminate Sequence [None] {4.3}	Terminate Sequence [None] {4.3}	Terminate Sequence [None] {4.3}	Terminate Sequence [None] {4.3}
Sequence Terminated Fault [msg] {4.2}	N/A		Terminate Sequence [None] {4.2}	Terminate Sequence [None] {4.2}	Terminate Sequence [None] {4.2}	Terminate Sequence [None] {4.2}
TerminateSequence [msg] {3.6}	Generate Unknown Sequence Fault [Same] {4.3}	Generate Unknown Sequence Fault [Same] {4.3}	Xmit Terminate Sequence Response [None] {3.6}	Xmit Terminate Sequence Response [None] {3.6}	Xmit Terminate Sequence Response [None] {3.6}	Generate Unknown Sequence Fault [Same] {4.3}
Terminate Sequence [int]	N/A	No action [None] {unspec}	Xmit Terminate Sequence [Terminating]	Xmit Terminate Sequence [Terminating]	Xmit Terminate Sequence [Terminating]	N/A
Terminate Sequence Response [msg]	Generate Unknown Sequence Fault [Same] {4.3}	Generate Unknown Sequence Fault [Same] {4.3}				Terminate Sequence [None] {3.6}
Expires exceeded [int]	N/A	Terminate Sequence [None] {3.7}	Terminate Sequence [None] {3.7}	Terminate Sequence [None] {3.7}	Terminate Sequence [None] {3.7}	Terminate Sequence [None] {3.7}
Invalid Acknowledgement [msg] [4.4]	Generate Unknown Sequence Fault [Same] {4.3}	Generate Unknown Sequence Fault [Same] {4.3}	Generate Invalid Acknowledgemen t Fault [Same] {4.4}	Generate Invalid Acknowledgemen t Fault [Same] {4.4}	Generate Invalid Acknowledgemen t Fault [Same] {4.4}	Generate Invalid Acknowledgemen t Fault [Same] {4.4}

## 445 Table 2 RM Destination Sequence State Transition Table

Frants		Sequence	States	
Events	None	Created	Closed	Terminating
CreateSequence (successful) [msg/int] {3.4}	Xmit Create Sequence Response [Created] {3.4}	N/A	N/A	

<b>F</b>	Sequence States						
Events	None	Created	Closed	Terminating			
CreateSequence (unsuccessful) [msg/int] {3.4}	Generate Create Sequence Refused Fault [None] {3.4}	N/A	N/A				
Message (with message number within range) [msg]	Generate Unknown Sequence Fault [Same] {4.3}	Accept Message; <xmit seqack=""> [Same]</xmit>	Generate Sequence Closed Fault (with SeqAck+Final) [Same] {3.5}	Generate Sequence Terminated Fault [Same] {4.2}			
Message (with message number outside of range) [msg]	Generate Unknown Sequence Fault [Same] {4.3}	Xmit Message Number Rollover Fault [Same] {3.7}{4.5}	Generate Sequence Closed Fault (with SeqAck+Final) [Same] {3.5}	Generate Sequence Terminated Fault [Same] {4.2}			
<ackrequested> [msg] {3.8}</ackrequested>	Generate Unknown Seq Fault [Same] {4.3}	Xmit SeqAck [Same] {3.8}	Xmit SeqAck+Final [Same] {3.9}	Generate Sequence Terminated Fault [Same] {4.2}			
CloseSequence [msg] {3.5}	Generate Unknown Sequence Fault [Same] {4.3}	Xmit CloseSequence Response with SeqAck+Final [Closed] {3.5}	Xmit CloseSequence Response with SeqAck+Final [Closed] {3.5}	Generate Sequence Terminated Fault [Same] {4.2}			
<closesequence autonomously&gt; [int]</closesequence 		Xmit CloseSequence with SeqAck+Final [Closed] {3.5}	Xmit CloseSequence with SeqAck+Final [Same] {3.5}				
CloseSequenceResponse [msg] {3.5}	Generate Unknown Sequence Fault [Same] {4.3}		No Action [Closed] {3.5}	Generate Sequence Terminated Fault [Same] {4.2}			
TerminateSequence [msg] {3.6)	Generate Unknown Sequence Fault [Same] {4.3}	Xmit Terminate Sequence Response [None] {3.6}	Xmit Terminate Sequence Response [None] {3.6}	Xmit Terminate Sequence Response [None] {3.6}			
<terminatesequence autonomously&gt; [int]</terminatesequence 		Xmit TerminateSequence with SeqAck+Final [Terminating] {3.6}	Xmit TerminateSequence with SeqAck+Final [Terminating] {3.6}	Xmit TerminateSequence with SeqAck+Final [Terminating] {3.6}			
TerminateSequenceResponse [msg]	Generate Unknown Sequence Fault [Same] {4.3}			Terminate Sequence [None]			
UnknownSequence Fault [msg] {4.3}		Terminate Sequence [None] {4.3}	Terminate Sequence [None] {4.3}	Terminate Sequence [None] {4.3}			
SequenceTerminated Fault [msg] {4.2}		Terminate Sequence [None] {4.2}	Terminate Sequence [None] {4.2}	Terminate Sequence [None] {4.3}			
Invalid Acknowledgement Fault [msg] {4.4}	N/A						
Expires exceeded	N/A	Terminate Sequence	Terminate Sequence				

Frants	Sequence States					
Events	None	Created	Closed	Terminating		
[int]		[None] {3.4}	[None] {3.4}			
<seq acknowledgement<br="">autonomously&gt; [int] {3.9}</seq>	N/A	Xmit SeqAck [Same] {3.9}	Xmit SeqAck+Final [Same] {3.9}			
Non WSRM message when WSRM required [msg] {4.8}	Generate WSRMRequired Fault [Same] {4.8}	Generate WSRMRequired Fault [Same] {4.8}	Generate WSRMRequired Fault [Same] {4.8}

This document is based on initial contribution to OASIS WS-RX Technical Committee by the following authors:

Ruslan Bilorusets(BEA), Don Box(Microsoft), Luis Felipe Cabrera(Microsoft), Doug Davis(IBM),
Donald Ferguson(IBM), Christopher Ferris-Editor(BM), Tom Freund(IBM), Mary Ann Hondo(IBM),
John Ibbotson(IBM), Lei Jin(BEA), Chris Kaler(Microsoft), David Langworthy-Editor(Microsoft),
Amelia Lewis(TIBCO Software), Rodney Limprecht(Microsoft), Steve Lucco(Microsoft), Don
Mullen(TIBCO Software), Anthony Nadalin(IBM), Mark Nottingham(BEA), David Orchard(BEA),
Jamie Roots(IBM), Shivajee Samdarshi(TIBCO Software), John Shewchuk(Microsoft), Tony
Storey(IBM).

453 The following individuals have provided invaluable input into the initial contribution:

Keith Ballinger(Microsoft), Stefan Batres(Microsoft), Rebecca Bergersen(Iona), Allen Brown(Microsoft), Michael Conner(IBM), George Copeland(Microsoft), Francisco Curbera(IBM), Paul Fremantle(IBM), Steve Graham(IBM), Pat Helland(Microsoft), Rick Hill(Microsoft), Scott Hinkelman(IBM), Tim Holloway(IBM), Efim Hudis(Microsoft), David Ingham(Microsoft), Gopal Kakivaya(Microsoft), Johannes Klein(Microsoft), Frank Leymann(IBM), Martin Nally(IBM), Peter Niblett(IBM), Jeffrey Schlimmer(Microsoft), James Snell(IBM), Keith Stobie(Microsoft), Satish Thatte(Microsoft), Stephen Todd(IBM), Sanjiva Weerawarana(IBM), Roger Wolter(Microsoft).

The following individuals were members of the committee during the development of this specification:

Abbie Barbir(Nortel), Charlton Barreto(Adobe), Stefan Batres(Microsoft), Hamid Ben 453 Malek(Fujitsu), Andreas Bjarlestam(Ericsson), Toufic Boubez(Layer 7), Doug Bunting(Sun), Lloyd 454 Burch(Novell), Steve Carter(Novell), Martin Chapman(Oracle), Dave Chappell(Sonic), Paul 455 Cotton(Microsoft), Glen Daniels(Sonic), Doug Davis(IBM), Blake Dournaee(Intel), Jacques 456 Durand(Fujitsu), Colleen Evans(Microsoft), Christopher Ferris(IBM), Paul Fremantle(WSO2), 457 458 Robert Freund(Hitachi), Peter Furniss(Erebor), Marc Goodner(Microsoft), Alastair Green(Choreology), Mike Grogan(Sun), Ondrej Hrebicek(Microsoft), Kazunori Iwasa(Fujitsu), 459 460 Chamikara Jayalath(WSO2), Lei Jin(BEA), Ian Jones(BTplc), Anish Karmarkar(Oracle), Paul Knight(Nortel), Dan Leshchiner(Tibco), Mark Little(JBoss), Lily Liu(webMethods), Matt 461 462 Lovett(IBM), Ashok Malhotra(Oracle), Jonathan Marsh(Microsoft), Daniel Millwood(IBM), Jeff Mischkinsky(Oracle), Nilo Mitra(Ericsson), Peter Niblett(IBM), Duane Nickull(Adobe), Eisaku 463 Nishiyama(Hitachi), Dave Orchard(BEA), Chouthri Palanisamy(NEC), Sanjay Patil(SAP), Gilbert 464 Pilz(BEA), Martin Raepple(SAP), Eric Rajkovic(Oracle), Stefan Rossmanith(SAP), Tom 465 Rutt(Fujitsu), Rich Salz(IBM), Shivajee Samdarshi(Tibco), Vladimir Videlov(SAP), Claus von 466 Riegen(SAP), Pete Wenzel(Sun), Steve Winkler(SAP), Ümit Yalçinalp(SAP), Nobuyuki 467 468 Yamamoto(Hitachi).

# **Appendix F. Revision History**

		- w	
Rev	Date	By Whom	What
wd-01	2005-07-07	Christopher Ferris	Initial version created based on submission by the authors.
ws-02	2005-07-21	Doug Davis	I011 (PT0S) added
wd-02	2005-08-16	Anish Karmarkar	Trivial editorial changes
ws-03	2005-09-15	Doug Davis	I019 and i028 (CloseSeq) added
wd-05	2005-09-26	Gilbert Pilz	i005 (Source resend of nacks messages when ack already received) added.
wd-05	2005-09-27	Doug Davis	i027 (InOrder delivery assurance spanning multiple sequences) added
wd-05	2005-09-27	Doug Davis	i020 (Semantics of "At most once" Delivery Assurance) added
wd-05	2005-09-27	Doug Davis	i034 (Fault while processing a piggy-backed RM header) added
wd-05	2005-09-27	Doug Davis	i033 (Processing model of NACKs) added
wd-05	2005-09-27	Doug Davis	i031 (AckRequested schema inconsistency) added
wd-05	2005-09-27	Doug Davis	i025 (SeqAck/None) added
wd-05	2005-09-27	Doug Davis	i029 (Remove dependency on WS-Security) added
wd-05	2005-09-27	Doug Davis	i039 (What does 'have a mU attribute' mean) added
wd-05	2005-09-27	Doug Davis	i040 (Change 'optiona'/'required' to 'OPTIONAL'/'REQUIRED') added
wd-05	2005-09-30	Anish Karmarkar	i017 (Change NS to http://docs.oasis- open.org/wsrm/200510/)
wd-05	2005-09-30	Anish Karmarkar	i045 (Include SecureConversation as a reference and move it to non-normative citation)
wd-05	2005-09-30	Anish Karmarkar	i046 (change the type of wsrm:FaultCode element)
wd-06	2005-11-02	Gilbert Pilz	Start wd-06 by changing title page from cd-01.
wd-06	2005-11-03	Gilbert Pilz	i047 (Reorder spec sections)
wd-07	2005-11-17	Gilbert Pilz	Start wd-07
wd-07	2005-11-28	Doug Davis	i071 – except for period in Appendix headings
wd-07	2005-11-28	Doug Davis	i10
wd-07	2005-11-28	Doug Davis	i030
wd-07	2005-11-28	Doug Davis	i037
wd-07	2005-11-28	Doug Davis	i038
wd-07	2005-11-28	Doug Davis	i041
wd-07	2005-11-28	Doug Davis	i043
wd-07	2005-11-28	Doug Davis	i044

Davi	Data	D. Mile and	Minak
Rev	Date	By Whom	What
wd-07	2005-11-28	Doug Davis	i048
wd-07	2005-11-28	Doug Davis	i051
wd-07	2005-11-28	Doug Davis	i053
wd-07	2005-11-28	Doug Davis	i059
wd-07	2005-11-28	Doug Davis	i062
wd-07	2005-11-28	Doug Davis	i063
wd-07	2005-11-28	Doug Davis	i065
wd-07	2005-11-28	Doug Davis	i067
wd-07	2005-11-28	Doug Davis	i068
wd-07	2005-11-28	Doug Davis	i069
wd-07	2005-11-28	Doug Davis	Fix bulleted list (#2) in section 2.3
wd-07	2005-11-29	Gilbert Pilz	i074 (Use of [tcShortName] in artifact locations namespaces, etc)
wd-07	2005-11-29	Gilbert Pilz	i071 – Fixed styles and formating for TOC. Fixed styles of the appendix headings.
wd-07	2005-11-30	Doug Davis	Removed dup definition of "Receive"
wd-07	2005-11-30	Gilbert Pilz	Fixed lost formatting from heading for Namespace section. Fixed style of text body elements to match OASIS example documents. Fixed tables to match OASIS example documents.
wd-07	2005-12-01	Gilbert Pilz	Updated fix for i074 to eliminate trailing '/'. Added corresponding text around action IRI composition.
wd-07	2005-12-01	Gilbert Pilz	Use non-fixed fields for date values on both title page and body footers.
wd-07	2005-12-01	Doug Davis	Alphabetize the glossary
wd-07	2005-12-02	Doug Davis	i064
wd-07	2005-12-02	Doug Davis	i066
wd-08	2005-12-15	Doug Davis	Add back in RM Source to glossary
wd-08	2005-12-15	Steve Winkler	Doug added Steve's editorial nits
wd-08	2005-12-21	Doug Davis	i050
wd-08	2005-12-21	Doug Davis	i081
wd-08	2005-12-21	Doug Davis	i080 – but i050 negates the need for any changes
wd-08	2005-12-21	Doug Davis	i079
wd-08	2005-12-21	Doug Davis	I076 – didn't add text about "replies" since the RMD to RMS sequence could be used for any message not just replies
wd-08	2005-12-21	Umit Yalcinalp	Action Su03: removed wsse from Table 1
wd-08	2005-12-21	Umit Yalcinalp	I057 per Sunnyvale F2F 2005, Cleaned up some formatting errors in contributors
wd-08	2005-12-27	Doug Davis	i060
wd-08	2005-12-27	Gilbert Pilz	Moved schema and WSDL files to their own artifacts. Converted source document to

Rev	Date	By Whom	What
ILCV	Date		OpenDocument Text format. Changed line
			numbers to be a single style.
wd-08	2005-12-28	Anish Karmarkar	Included a section link to c:\temp\wsrm-1.1-schema-200510.xsd and to c:\temp\wsrm-1.1-wsdl-200510.wsdl
wd-08	2006-01-04	Gilbert Pilz	Fixed formatting for included sections.
wd-08	2006-01-05	Gilbert Pilz	Created links for unused references. Fixed exemplars for CloseSequence and CloseSequenceResponse.
wd-09	2006-01-11	Doug Davis	Minor tweaks to text/typos.
wd-10	2006-01-23	Doug Davis	Accept all changes from wd-09
			Make some minor editoral tweaks from Marc's comments.
wd-10	2006-02-14	Doug Davis	Issue 082 resolution
wd-10	2006-02-14	Doug Davis	Issue 083 resolution
wd-10	2006-02-14	Doug Davis	Issue 085 resolution
wd-10	2006-02-14	Doug Davis	Issues 086, 087 resolutions
			Defined MessageNumberType
wd-10	2006-02-15	Doug Davis	Issue 078 resolution
wd-10	2006-02-15	Doug Davis	Issue 094 resolution
wd-10	2006-02-15	Doug Davis	Issue 095 resolution
wd-10	2006-02-15	Gilbert Pilz	Issue 088 – added namespace URI link to namespace URI; added text explaining that this URI could be dereferenced to produce the RDDL doc; added non-normative reference to RDDL 2.0
wd-10	2006-02-17	Anish Karmarkar	Namespace changed to 200602 for both WSDL and XSD docs.
wd-10	2006-02-17	Anish Karmarkar	Issue i087 as it applies to WSRM spec.
wd-10	2006-02-17	Anish Karmarkar	Added titles and minor text for state table (issue i058).
wd-11	2006-02-22	Doug Davis	Accept all changes for new WD
			Minor typos fixed
wd-11	2006-02-23	Doug Davis	s/'close'/close/g – per Marc Goodner
			Added first ref to [URI] – per Marc G again
wd-11	2006-02-27	Doug Davis	Issue i061 applied
wd-11	2006-02-27	Doug Davis	Fixed typo around the use of "above" and
	2000 02 20	2009 20110	"below"
wd-11	2006-03-01	Doug Davis	Minor typos found by Marc Goodner
wd-11	2006-03-02	Doug Davis	Minor typos found by Matt Lovett
wd-11	2006-03-08	Doug Davis	Issue 091 applied
wd-11	2006-03-08	Doug Davis	Issue 092 applied
wd-11	2006-03-08	Doug Davis	Issue 100 applied

Rev	Date	By Whom	What
wd-12	2006-03-20	Doug Davis	Added space in "SOAP1.x" – PaulCotton
wd-12	2006-04-11	Doug Davis	Issue 007 applied
wd-12	2006-04-11	Doug Davis	Issue 090 applied
wd-12	2006-04-11	Doug Davis	Issue 098 applied
wd-12	2006-04-11	Doug Davis	Issue 099 applied
wd-12	2006-04-11	Doug Davis	Issue 101 applied
wd-12	2006-04-11	Doug Davis	Issue 103 applied
wd-12	2006-04-11	Doug Davis	Issue 104 applied
wd-12	2006-04-11	Doug Davis	Issue 105 applied
wd-12	2006-04-11	Doug Davis	Issue 107 applied
wd-12	2006-04-11	Doug Davis	Issue 109 applied
wd-12	2006-04-11	Doug Davis	Issue 110 applied
wd-12	2006-04-12	Doug Davis	Used "generated" instead of "issue" or "send" when talking about faults.
wd-12	2006-04-24	Gilbert Pilz	Update references to WS-Addressing to the Proposed Recommendations; update WS-RM namespace to "200604".
wd-13	2006-05-08	Gilbert Pilz	i093 part 1; more work needed
wd-13	2006-05-10	Doug Davis	Issue 096 applied
wd-13	2006-05-26	Gilbert Pilz	i093 part 2; reflects decisions from 2006-05-25 meeting
wd-13	2006-05-28	Gilbert Pilz	Issue 106 applied
wd-13	2006-05-29	Gilbert Pilz	Issue 118 applied
wd-13	2006-05-29	Gilbert Pilz	Issue 120 applied
wd-13	2006-05-30	Gilbert Pilz	Issue 114 applied
wd-13	2006-05-30	Gilbert Pilz	Issue 116 applied
wd-14	2006-06-05	Gilbert Pilz	Accept all changes; bump WD number
wd-14	2006-06-07	Doug Davis	Applied lots of minor edits from Marc Goodner
wd-14	2006-06-07	Doug Davis	Change a couple of period/sp/sp to period/sp
wd-14	2006-06-07	Doug Davis	Added a space in "URI])of" – per Marc Goodner
wd-14	2006-06-07	Doug Davis	Issue 131 applied
wd-14	2006-06-07	Doug Davis	Issue 132 applied
wd-14	2006-06-07	Doug Davis	Issue 119 applied
wd-14	2006-06-07	Doug Davis	Applied lots of minor edits from Doug Davis
wd-14	2006-06-07	Doug Davis	s/"none"/"full-uri"/ - per Marc Goodner
wd-14	2006-06-12	Doug Davis	Complete i106
wd-14	2006-06-12	Doug Davis	Issues 089 applied
wd-14	2006-06-12	Doug Davis	Fix for several RFC2119 keywords – per Anish
wd-15	2006-06-12	Doug Davis	Accept all changed, dump WD number
wd-15	2006-06-12	Doug Davis	Move WSDL after Schema
wd-15	2006-06-12	Doug Davis	Nits – remove tabs, extra [yyy]'s

wd-15	2006-06-16	Doug Davis	Issue 127 applied
wd-15	2006-06-16	Doug Davis	Issue 133 applied
wd-15	2006-06-16	Doug Davis	Issue 136 applied
wd-15	2006-06-16	Doug Davis	Issue 138 applied
wd-15	2006-06-16	Doug Davis	Issue 135 applied
wd-15	2006-06-20	Doug Davis	Added all TC members to the ack list
wd-15	2006-06-22	Doug Davis	Issue 129 applied
wd-15	2006-06-22	Doug Davis	Issue 130 applied
wd-15	2006-06-22	Doug Davis	Issue 137 applied
wd-15	2006-06-26	Doug Davis	Issue 111 applied
wd-15	2006-06-26	Doug Davis	Missed a part of issue 129
wd-15	2006-06-30	Doug Davis	Fixed a typo in schema
wd-15	2006-06-30	Doug Davis	Issue 141 applied
wd-15	2006-06-30	Doug Davis	Issue 142 applied
wd-15	2006-06-30	Doug Davis	Issue 148 applied
wd-15	2006-06-30	Doug Davis	Issue 149 applied
wd-15	2006-06-30	Doug Davis	Issue 150 applied
wd-15	2006-07-06	Doug Davis	Issue 121 applied
wd-15	2006-07-21	Doug Davis	Issue 139 applied
wd-15	2006-07-21	Doug Davis	Issue 144 applied
wd-15	2006-07-21	Doug Davis	Issue 147 applied
wd-15	2006-07-21	Doug Davis	Issues 122-124 applied
wd-15	2006-07-27	Doug Davis	Updated list of oasis TC members (i134)
wd-15	2006-07-27	Doug Davis	Issue 140 applied
wd-15	2006-07-27	Doug Davis	Issue 145 applied
wd-15	2006-07-27	Doug Davis	Issue 143 applied
wd-15	2006-07-28	Doug Davis	Lots of minor typos found by Matt L.
wd-15	2006-07-28	Doug Davis	Issue 113 applied
wd-15	2006-08-04	Doug Davis	Update old namespaces – found by PaulC
wd-15	2006-08-04	Doug Davis	Issue 150 applied
wd-15	2006-08-04	Doug Davis	Minor typos – found by PeterN
wd-15	2006-08-04	Doug Davis	Verify all [refs]
wd-15	2006-08-04	Doug Davis	Change namespace to 2006/08
wd-15	2006-08-04	Doug Davis	Issue 148 applied
wd-15	2006-08-07	Doug Davis	Add some new glossary terms – per GilP
cd-04	2006-08-10	Gilbert Pilz	Formatting changes for better HTML rendering.

Rev	Date	By Whom	What
cd-04	2006-08-11	Doug Davis	Issue 158 applied
cd-04	2006-08-11	Doug Davis	Issue 153 applied
cd-04	2006-08-11	Doug Davis	Issue 156 applied
cd-04	2006-08-15	Gilbert Pilz	More formatting changes for better HTML rendering.
wd-16	2006-10-25	Doug Davis	Accept all changes, update to wd16
wd-16	2006-10-26	Doug Davis	PR002 applied
wd-16	2006-10-26	Doug Davis	PR003 applied
wd-16	2006-10-26	Doug Davis	PR004 applied
wd-16	2006-10-27	Doug Davis	PR005 applied
wd-16	2006-10-27	Doug Davis	PR006 applied
wd-16	2006-10-27	Doug Davis	PR024 applied
wd-16	2006-11-13	Doug Davis	PR010 applied
wd-16	2006-11-13	Doug Davis	PR011 applied (technically as part of PR004)
wd-16	2006-11-13	Doug Davis	PR016 applied
wd-16	2006-11-13	Doug Davis	PR032 applied
wd-16	2006-11-20	Doug Davis	PR025 applied
wd-16	2006-11-20	Doug Davis	PR023 applied
wd-16	2006-12-03	Doug Davis	PR036 applied
wd-16	2006-12-03	Doug Davis	PR017 applied
wd-16	2006-12-11	Doug Davis	PR012 applied (and PR013)
wd-16	2006-12-14	Doug Davis	PR033 applied – changed a 'return' to 'generate' when talking about a fault
wd-16	2007-01-04	Doug Davis	PR018 applied
wd-16	2007-01-05	Doug Davis	Moved MakeConnection to new spec
wd-16	2007-01-17	Doug Davis	PR026 applied
wd-16	2007-01-18	Doug Davis	PR021 applied
wd-16	2007-01-18	Doug Davis	PR022 applied
wd-16	2007-01-18	Doug Davis	Fixed a few typos (Doug,Gil)
wd-16	2007-01-18	Gilbert Pilz	PR007 applied
wd-16	2007-01-25	Doug Davis	PR039 applied

# 454 Appendix G. Notices

- OASIS takes no position regarding the validity or scope of any intellectual property or other rights that
- 456 might be claimed to pertain to the implementation or use of the technology described in this document or
- 457 the extent to which any license under such rights might or might not be available; neither does it represent
- 458 that it has made any effort to identify any such rights. Information on OASIS's procedures with respect to
- 459 rights in OASIS specifications can be found at the OASIS website. Copies of claims of rights made
- 460 available for publication and any assurances of licenses to be made available, or the result of an attempt
- 461 made to obtain a general license or permission for the use of such proprietary rights by implementors or
- users of this specification, can be obtained from the OASIS Executive Director.
- OASIS invites any interested party to bring to its attention any copyrights, patents or patent applications, or
- 456 other proprietary rights which may cover technology that may be required to implement this specification.
- 457 Please address the information to the OASIS Executive Director.
- 455 Copyright (C) OASIS Open (2006). All Rights Reserved.
- 455 This document and translations of it may be copied and furnished to others, and derivative works that
- 456 comment on or otherwise explain it or assist in its implementation may be prepared, copied, published and
- distributed, in whole or in part, without restriction of any kind, provided that the above copyright notice and
- 458 this paragraph are included on all such copies and derivative works. However, this document itself may
- not be modified in any way, such as by removing the copyright notice or references to OASIS, except as
- 460 needed for the purpose of developing OASIS specifications, in which case the procedures for copyrights
- defined in the OASIS Intellectual Property Rights document must be followed, or as required to translate it
- 462 into languages other than English.
- 455 The limited permissions granted above are perpetual and will not be revoked by OASIS or its successors
- 456 or assigns.
- 455 This document and the information contained herein is provided on an "AS IS" basis and OASIS
